

User Guide for Partners

Welcome to the Show! Splunk Show is a platform to request demonstration instances across Splunk Cloud, Splunk Enterprise, SOAR, Observability Cloud, Splunk Cloud Services (SCS) and beyond.

This doc will aim to walk you through the major steps in navigating the interface and some best practices when requesting instances.

Click-through tutorial: Visit splunk.show/tutorial to get a quick guided tour of the Splunk Show UI including:

- Navigating Splunk Show
- Creating a Demo
- Creating a Workshop
- and more!

Signing In

Navigate to <https://show.splunk.com> to get started. You will be automatically redirected to the Splunk website login workflow. Once you are successfully logged in, you will be directed back into the Splunk Show UI.

Only seeing the Public page when you log in?

If you see a very limited view when you log in to Show, this means that you haven't been granted the correct access. Please email the Show team at splunk-show@cisco.com to request access to demos and workshops.

My Page

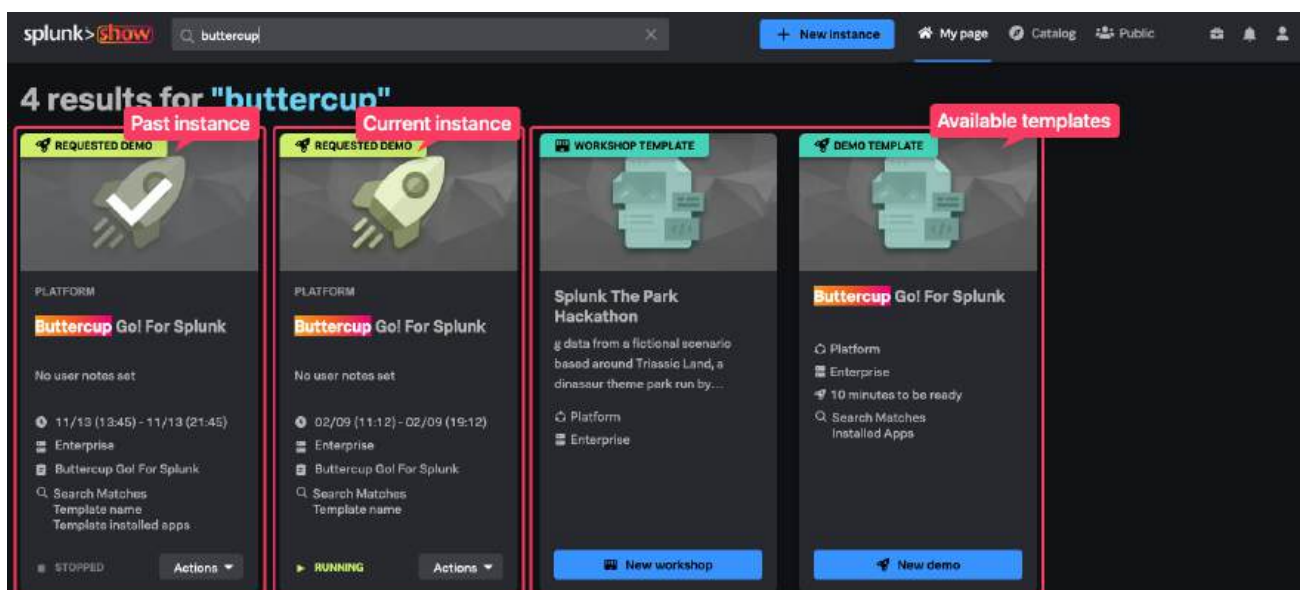

By default, you will land on your personal home page. This page presents an overview of your Show usage.

Not seeing any of these tabs?

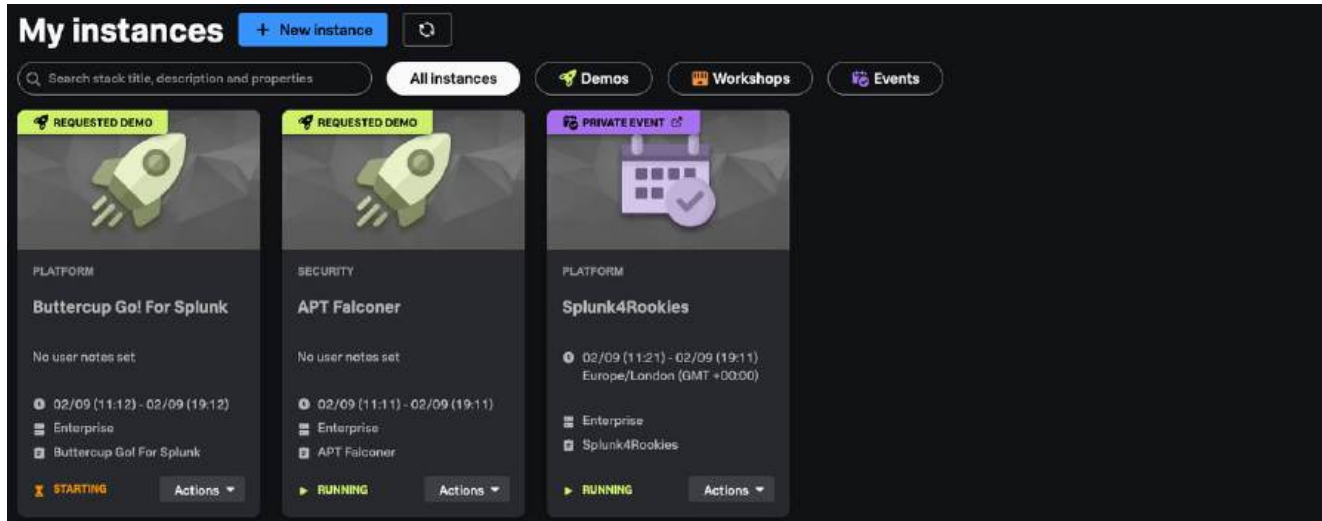

If you don't see any of these tabs this means that you haven't been granted the correct access. Please email the Show team at splunk-show@cisco.com to request access to demos and workshops.

- **Search bar** - use this to search for any content in Splunk Show. Results will include both demo/workshop templates as well as past and current instances you have requested.

Example of searching using the search bar

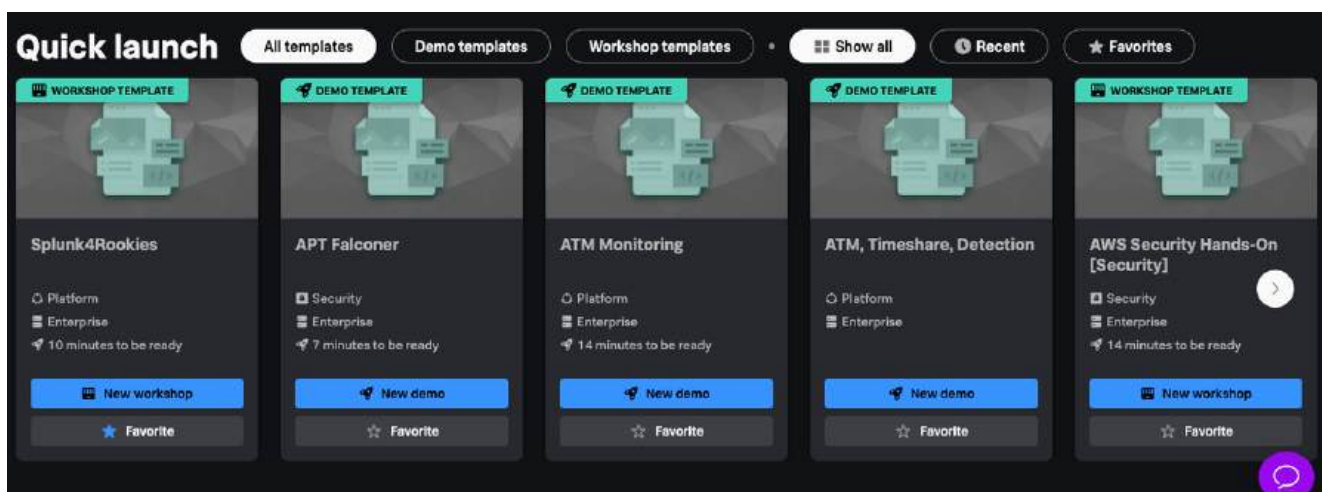

- **+ New Instance** button - takes you to the **Select a template** page to browse all Show demo/workshop templates
- **Overview** - includes key statistics about your Splunk Show usage
- **My instances** - provides a quick view of your currently running Show instances with the ability to filter by only demos, workshops or events. Click on the **Actions** button on any of the listed instances for quick access to common management tasks for your demo/workshop/event (see [Managing a Demo](#) for more information on these actions.)

A list of your current instances along with their status

- **Quick launch** - provides a quick view of the available templates (i.e. demos and workshops) in alphabetical order with the option to filter. Scroll left and right by clicking on the white directional arrows. Any templates that have added as a 'Favorite' will be listed first in this list.

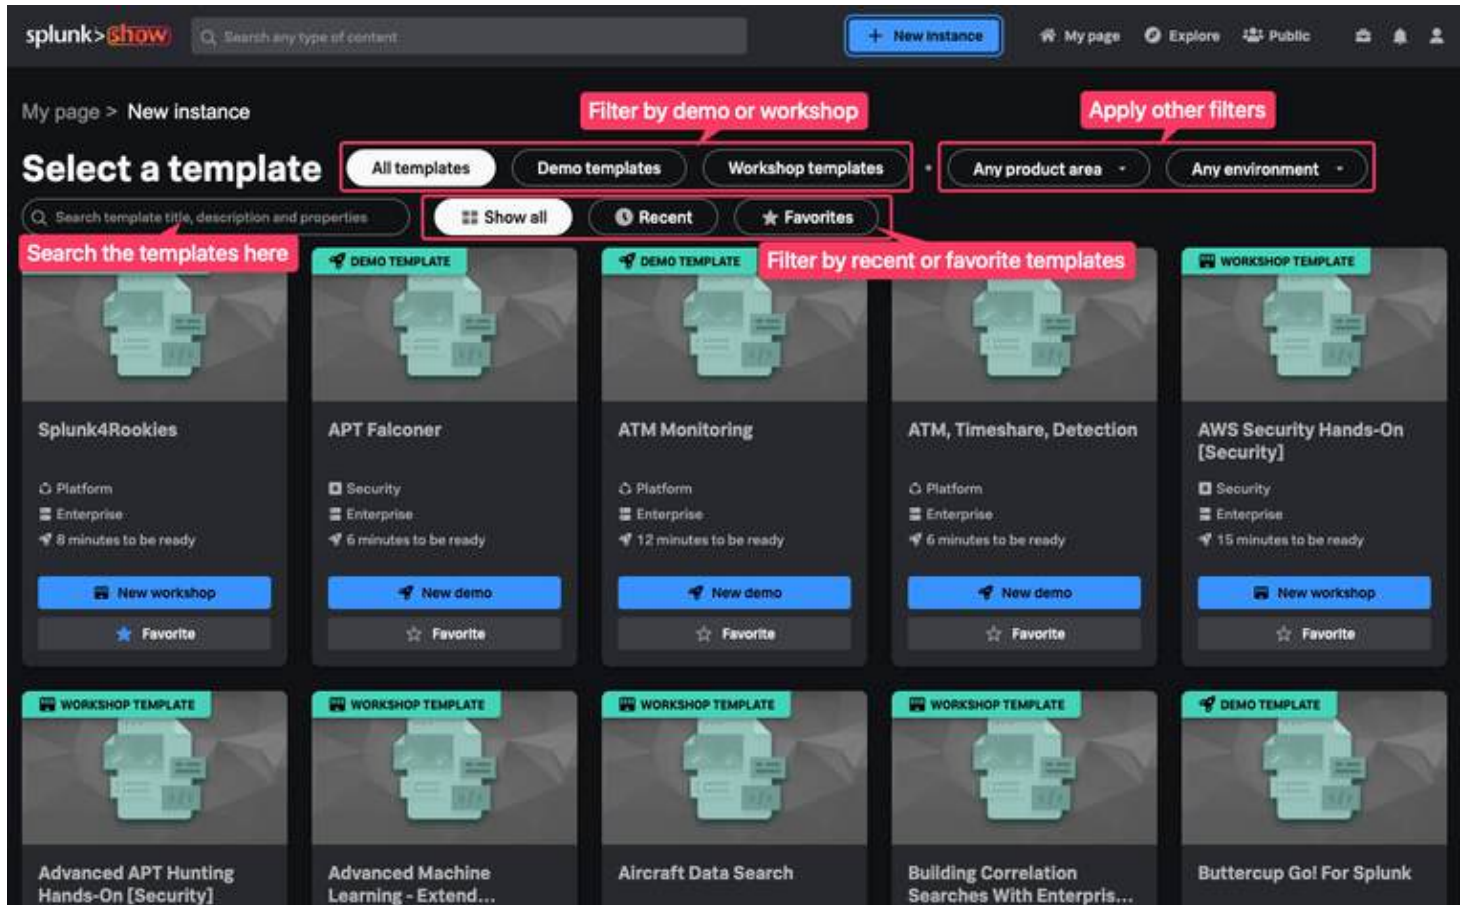

For a full list of templates click on **+ New Instance** at the top of the page.

The Home page 'Quick launch' view with a 'Favorite' template shown first in the list

Find a Demo or Workshop (New Instance / Select a Template Page)

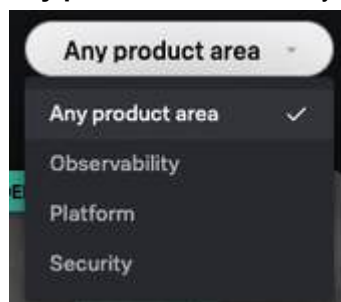

When you click on **+ New Instance** button on the home page you will be taken to the **Select a template** page.

Filter options when searching templates

Use the filters at the top of the page to filter the template view depending on the type of content you're looking for. The currently available filters are:

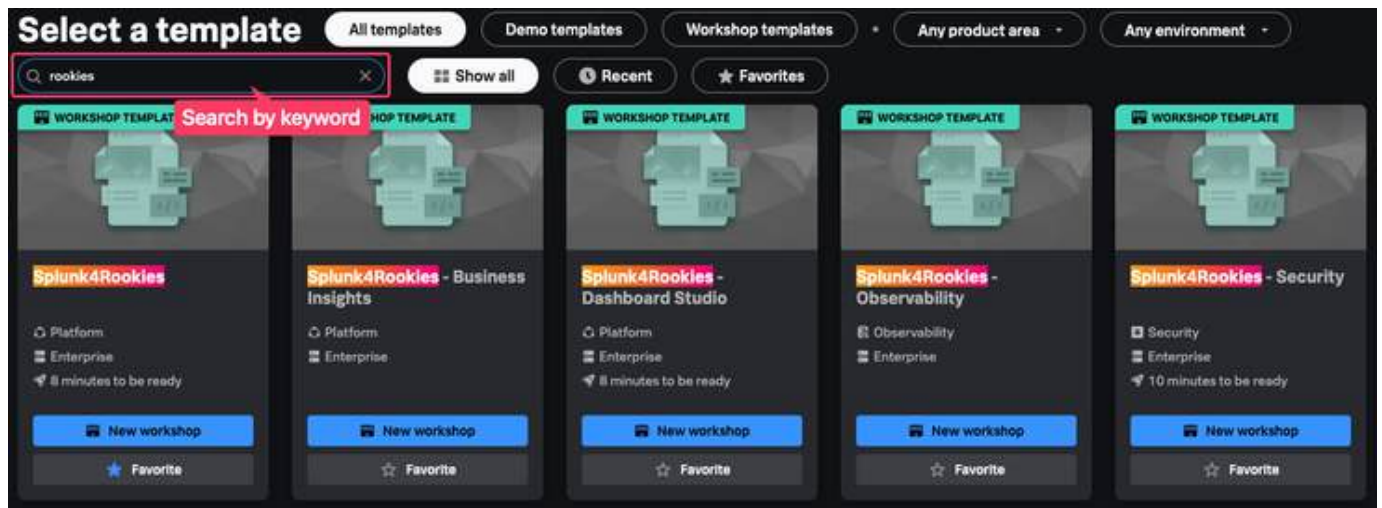

- **All templates** - view all currently published templates
- **Demo templates** - view only demos
- **Workshop templates** - view only workshops
- **Any product area** - filter by product area (security, observability or platform)

- **Any environment** - filter by the type of demo/workshop environment (Splunk Cloud, Splunk Enterprise or Hybrid which means a mixture of two or more environment types)

- **Search bar** - enter keywords to search the template titles, descriptions and other properties, such as installed apps.

- **Show all** - show all results, not just your recent or favorite templates. Selecting this will override the 'Recent' or 'Favorites' options.
- **Recent** - filters the search results to only show those templates that you recently used. Selecting this will override the 'Show all' or 'Favorites' options.
- **Favorites** - filters the search results to only show those templates that you marked as a 'Favorite' (by clicking on the 'Favorite' button for that template). Selecting this will override the 'Show all' or 'Recent' options.

View Template Information

Click on a template tile (not the ‘New...’ button but the tile itself) to view information about that template.

Access the enablement materials for this template

Give content feedback about this template!

Example of information presented when viewing a template. Note that not all possible template metadata is shown in this screenshot.

Product area - the product area that this template most closely maps to, i.e. security, observability or platform.

Platform - whether this template leverages Splunk Cloud (“Cloud”), Splunk Enterprise (“Enterprise”) or a mixture of environments, including SCS and SOAR (“Hybrid”).

Minutes to be ready - an approximate time that this template will take to provision. This value is based on recent provisioning metrics and so can vary over time depending on the load being placed on the Splunk Show backend services.

Description - a general description of the template including any important information you need to know about this demo, such as additional configuration required, etc.

Instructions - (only displayed in some templates) outlines any additional instructions that you should know about this template, such as how long data backfill takes to complete before your demo is fully ready to use.

Example of additional instructions included in a demo template.
Not all templates include this section.

Installed apps - (only displayed for Cloud-based templates) displays the Splunk apps installed in this template during the provisioning process.

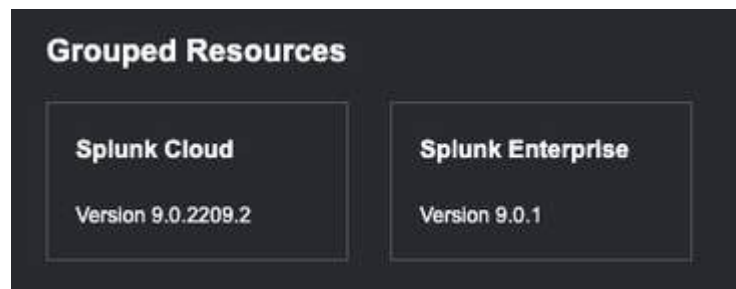

Sourcetypes - (only displayed for single instance templates) displays the source types included in this template.

Datagen Source - (only displayed in some templates) displays the demo data sets included in this template. Note that ‘friendly’ names are used here, e.g. “InfoSec Data” and specific source type names are displayed under the ‘Sourcetypes’ section (see above).

Grouped Resources - (only displayed in some templates) where a template includes more than one platform type, this section is included to indicate the platforms included and the versions for each.

Grouped resources example 1

Grouped resources example 2

Additional Information - additional useful metadata about the template, including:

- **Last update** - the date when this template was last modified.
- **Version** - (only displayed in some templates) the Splunk product version that this template leverages.
Note: where a template includes more than one platform, for example both a Splunk Enterprise and a Splunk Cloud instance, the version numbers will be displayed under the *Group Resources* section (see above) rather than under Additional Information.

Enablement Materials - a link to the relevant enablement materials for this template, including the demo script.

Submit Content Feedback - send content improvement feedback directly to the content owner by clicking this button and filling out the form in the popup Send Feedback window.

Experiencing Technical Issues with a Show Instance?

The Submit Content Feedback button should only be used for content improvement feedback.

If you are experiencing technical issues related to the running of a Splunk Show demo/workshop - such as instances not spinning up or data not appearing in a specific instance - please raise a support request (see [Support Requests](#).)

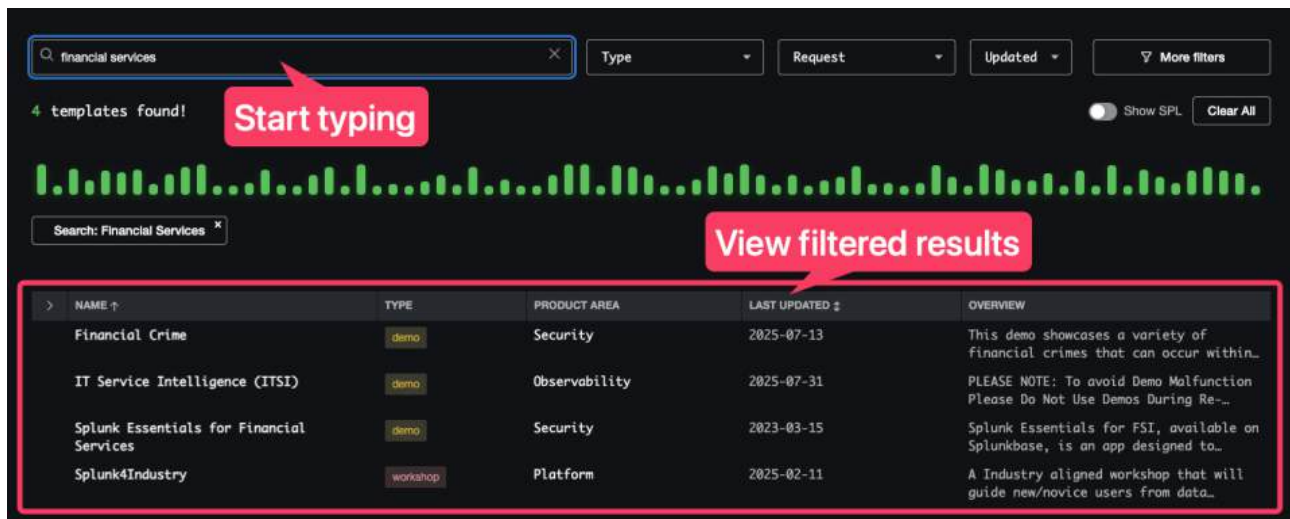

Catalog Page

The Catalog page provides a tabular view of all content that you have access to in Splunk Show.

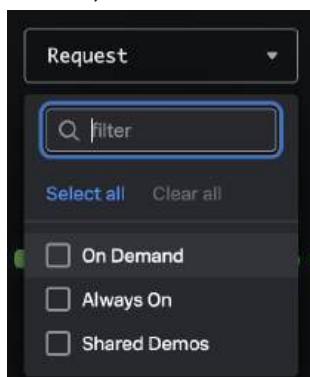

- **Search field** - Simply type key words to quickly and dynamically filter the list.

- **Type dropdown** - Filter by type of content, such as demos or workshops

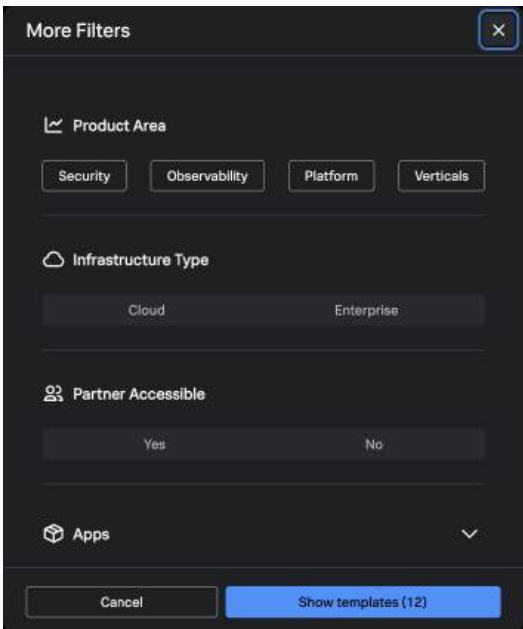

- **Request dropdown** - Filter by the type of request, such as on-demand demos, always on demos (formerly called “static demos”) or shared demos.

- **Updated** dropdown - Use this to filter by content that was recently updated, such as the last 30 days.

- **More filters** - Provides an additional set of filters to help you further refine the results.

i Shared Demos

For more information on leveraging shared demos please see [Shared Demos](#).

i Always On Demos

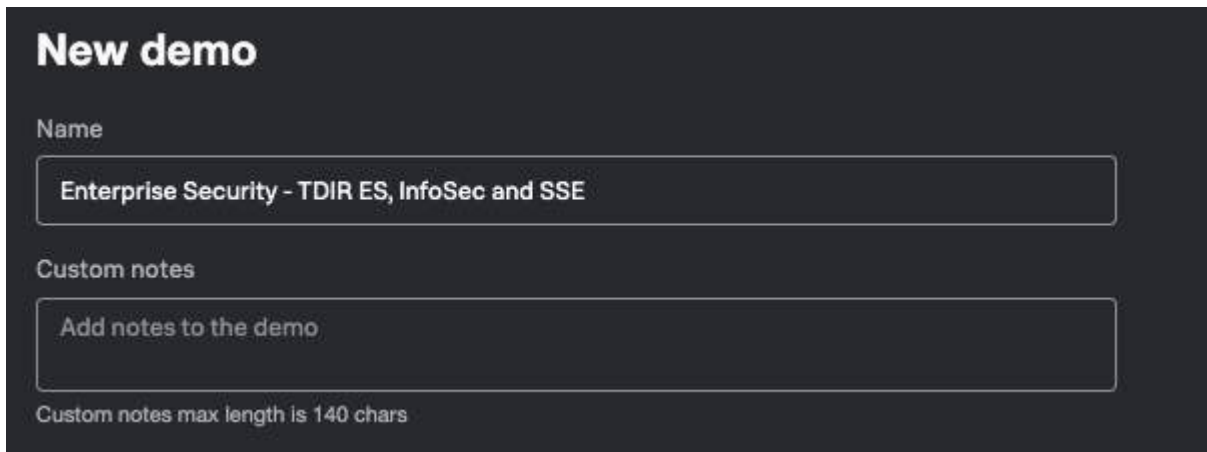

For more information on using always on demos please see [Always On \(Static\) Demos](#).

Create a Demo (New Demo Page)

When you click on the **New demo** button for a demo template you are taken to the **New demo** page with the following options available to you:

Note: These options may vary by template

New demo

New demo

Name

Enterprise Security - TDIR ES, InfoSec and SSE

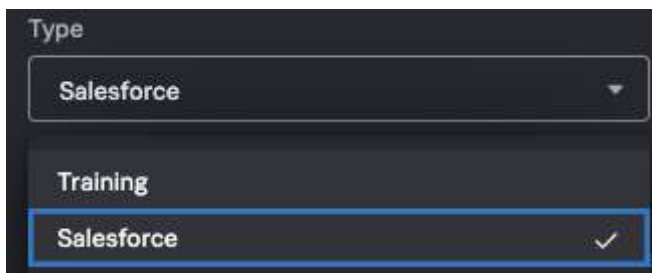

Custom notes

Add notes to the demo

Custom notes max length is 140 chars

- **Name** - the customizable name of the demo instance
- **Custom notes** - a free text field for any internal notes related to this demo

Use Case

Type

Salesforce

Training

Salesforce

The reason for the demo instance, which has three options:

- **Training** - (not suitable for customer facing activities) the demo instance is for learning the demo. When you select this option the following limits will apply:
 - You will be limited to only 1 instance per demo/workshop template in Show
 - You will be limited to a maximum runtime of 1 day

- **SFDC (Salesforce.com) activity** - the instance is being spun up for a customer-facing activity related to one of the following Salesforce entities:

Use Case

SFDC activity [\(use training activity\)](#)

ID Type

Select a type ▼

ID Number ⓘ

Enter an existing ID

- **ID Type**
 - Account
 - Opportunity
- **ID Number** - Simply enter the name of the customer you are running the demo for - no formal Salesforce ID is required.

Network

Network

SSH access

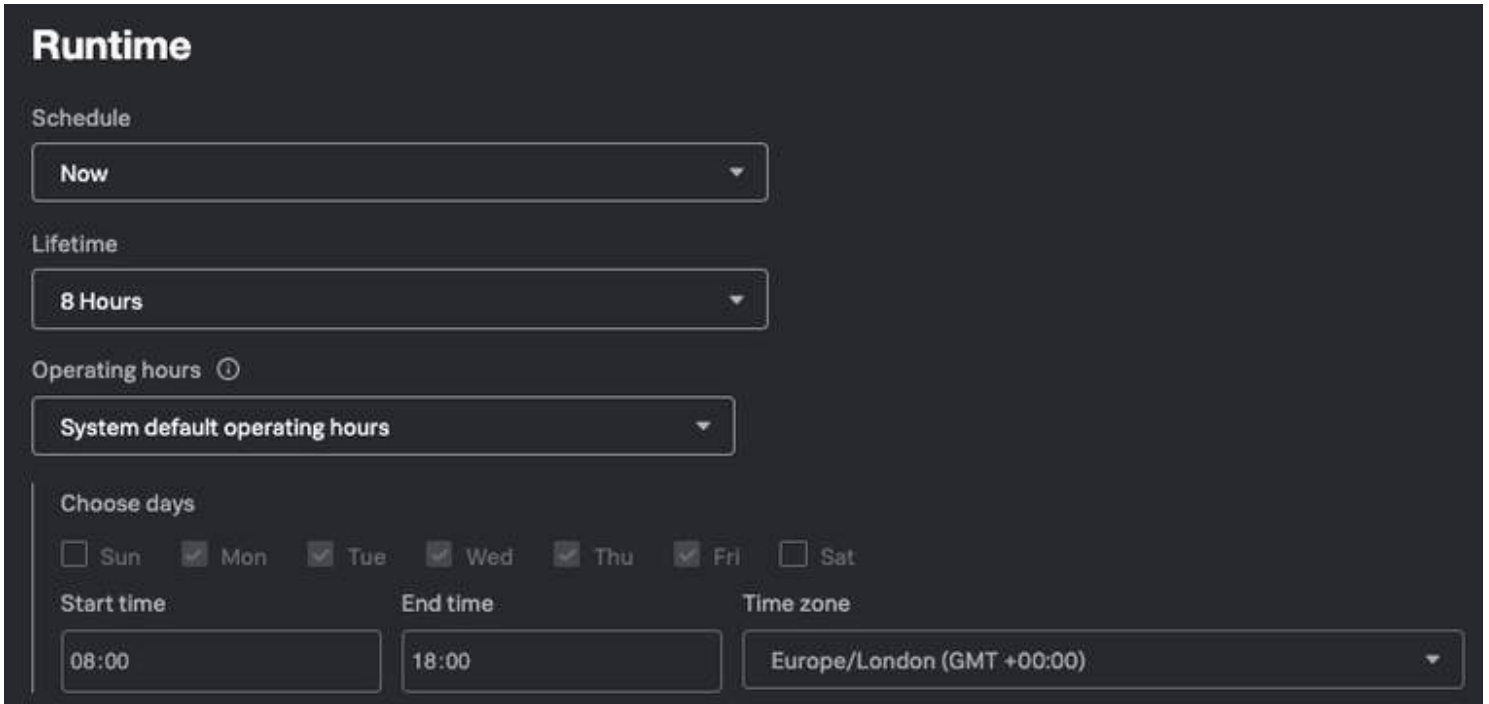

☐

- **SSH access** - (only available on some Some Enterprise based templates) this option allows you to enable SSH access to the instance. Once enabled, the SSH access information will be available under the instance details alongside your Splunk login credentials.

i Considerations when enabling SSH access

- For security reasons SSH access for demo instances **requires a full tunnel VPN connection**. Split tunnels (“Best Available”) will not work for SSH.
- Due to the VPN requirement SSH access is **not available to partners**.
- SSH access in Splunk Show uses **port 2222** instead of standard port 22.
- SSH is **not available for Cloud instances**, as the Cloud Orchestration (CO2) service does not allow user/pass authentication to its instances. This is noted within the Splunk Show UI.

Runtime

Runtime

Schedule

Now

Lifetime

8 Hours

Operating hours ⓘ

System default operating hours

Choose days

☐ Sun ☒ Mon ☒ Tue ☒ Wed ☒ Thu ☒ Fri ☐ Sat

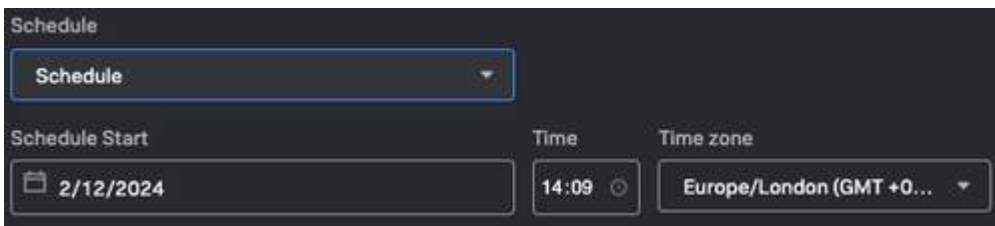

Start time End time Time zone

08:00 18:00 Europe/London (GMT +00:00)

Provides options to customise the running schedule for your instance(s).

Options include:

- **Schedule** - select whether you want your demo to be spun up
 - **Now** - spins up the demo immediately
 - **Schedule** - enter a future date/time to have Show schedule the provisioning
If you select Schedule you have the following additional options:
 - **Schedule Start** - the date when your demo will be spun up
 - **Time** - the time (on the 'Schedule Start' date) when your demo will be spun up
 - **Time zone** - the time zone for the 'Time' value provided

Schedule

Schedule

Schedule Start Time Time zone

2/12/2024 14:09 Europe/London (GMT +00:00)

Options available when scheduling an instance

- **Lifetime** - the Time-to-Live (TTL) for your demo (minimum of 2 hours, maximum of 14 days.)

Note: If you select 'Training' for your use case you will be limited to a maximum lifetime of 1 day. If you need the demo to run for longer, enter a Salesforce activity for the use case.

- **Operating hours** - (can only be changed on Splunk Enterprise based templates) this allows you to create a custom schedule for the instance, selecting the days and time window you would like to have the instance available. Once selected, Splunk Show will automatically pause/restart the instance at the scheduled time.

i Splunk Cloud based templates

Splunk Cloud instances must run 24/7 and their operating hours cannot be customized. This is noted within the Splunk Show UI.

The available time window selections are:

- **System default operating hours** - this is the default choice, which will set a typical business hour schedule from 8:00AM-6:00PM localized for your timezone (as reported by the browser).
- **User default operating hours** - Within Account Settings > Preferences > Scheduled Instances, there is a place to set a user-defined schedule if you operate outside of typical business hours, or have use cases that require different time windows.
- **Custom operating hours** - this option is to set a schedule for that specific instance in cases where a one-off schedule is required.

Example of using 'Custom operating hours'

If you select Custom operating hours you have the following additional options:

- **Choose days** - select the specific days of the week and hours of the day when you want your instance(s) to run. Please consider the cost implications of running instances for extended hours.
- **Run always (24/7)** - the instance will not follow a schedule and will remain online the entire specified time. Note that Splunk Cloud stacks can only run 24/7.

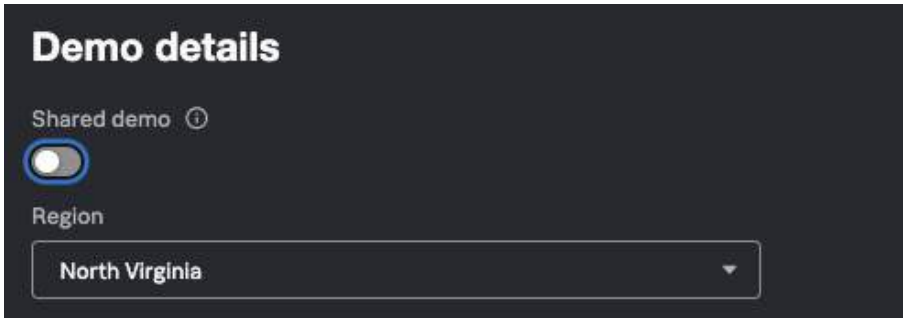

Available options for instance 'Operating hours'

Example message where a template is Cloud based and the schedule cannot be customized

17 Time Formats

Splunk Show displays time in either 12 or 24 hour format, according to your OS and browser settings. If you wish to change from one format to another please adjust these settings in your OS/browser.

Demo Details

Demo details

Shared demo ⓘ

Region

North Virginia ▼

- **Shared demo** - select whether this demo will be shared with other Splunk Show users. Enabling this will make this demo visible to all Splunk Show users under the **Shared** demos section. (see [Shared Demos](#)).

i Shared Demos

Shared demos are visible and accessible to all Splunk Show users. Their lifetime (TTL) can also be extended by anyone, though only the creator is able to stop them.

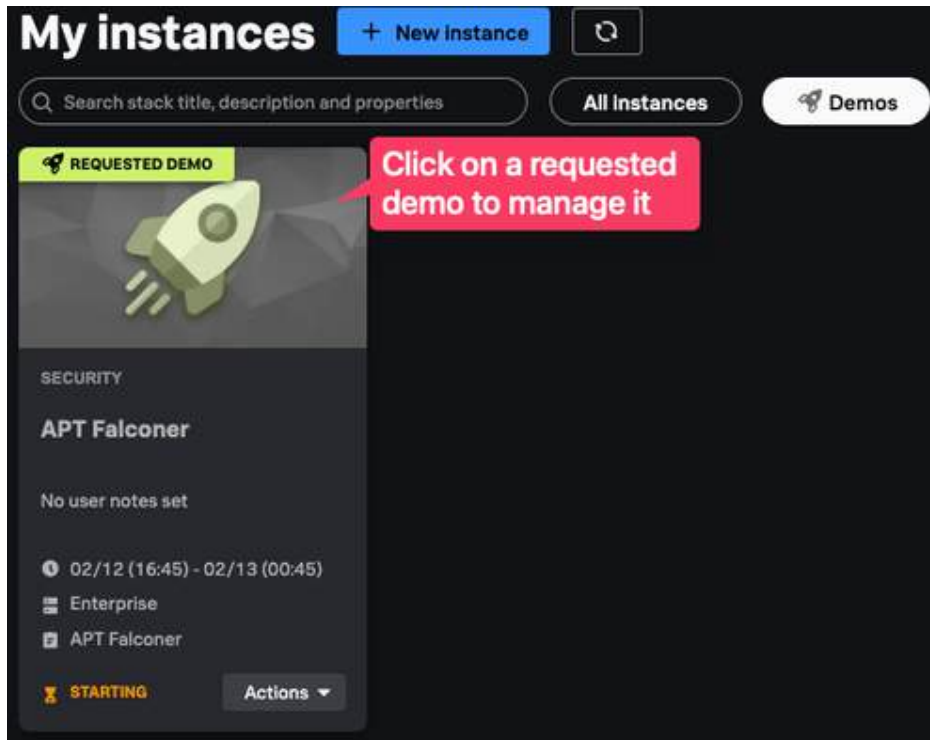

- **Region** - the AWS region that your instance will be provisioned in. Defaults to **North Virginia** but the default setting can be adjusted under Account Settings > Preferences > Preferred Region.

Total Cost to Splunk

- **Total Cost to Splunk** - an estimated cost per instance (to Splunk) of running the demo with the current settings. Reduce this number by customising the **Runtime** settings where possible (see below).
- **New Demo** - button to create your demo once all mandatory fields on this page have been completed.

Managing a Demo

To manage a demo, locate the requested demo on the home page under **My instances** and click on the requested demo.

Click on a demo to access the management view

You will be presented with the management page for your demo.

Memory Utilization

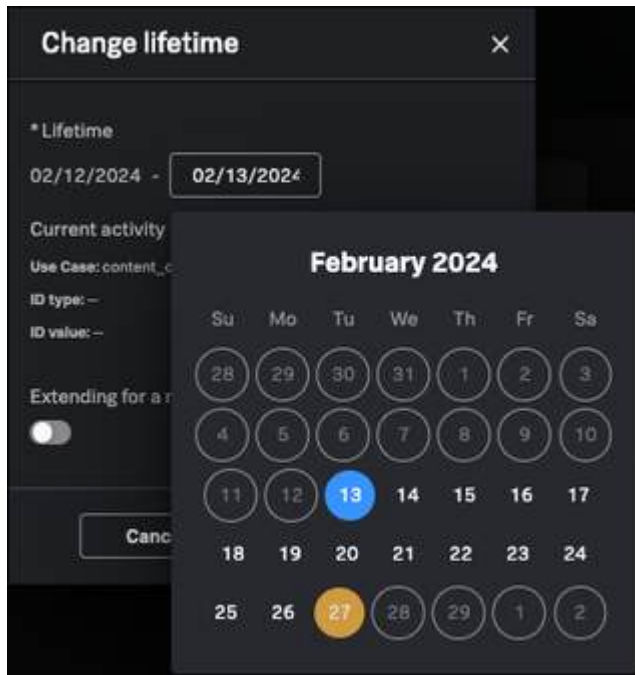

Example of a management page for a running demo

Much of this page is self explanatory but please note the following options:

Extend Demo Instances (Change lifetime)

Extend an instance by using the **Change lifetime** option. When extending instances, the status of the demo/workshop will briefly change to PENDING while the lifetime value is updated, and will return to the RUNNING state when the extension is complete.

Select a new termination date for your instances using the Change lifetime option

The normal process of extending up to 14 days for SFDC activities has not changed, however, a new range will now appear in the time picker that expands outside of the "allowed" range that will send a request to the Splunk Show team to approve the request.

i 14 day Limit for Extending Cloud Instances

Cloud-based demos - such as those which leverage Splunk Cloud Platform, SOAR or Splunk Cloud Services (SCS) - can only be extended a maximum of 14 days each time. While there is no limit to the number of times you can extend a Cloud instance, you can only do so in 14 day increments.

Pause Demo Instances

(Only available for Splunk Enterprise instances) Use the **Pause** option to temporarily pause the instance(s). This will put the demo into a SUSPENDED state.

When suspended, the instance is taken offline and will not be accessible until it is restarted. This is particularly useful in cases where demos or workshops don't complete in the initial meeting and are required for a follow-up, but aren't needed in between. A great use case here would be for running customer workshops where only part of the work gets completed. The instances can be suspended and then restarted when it is time to meet with the customer again.

Resume a Paused Demo Instance

When a demo instance is paused (i.e. a "SUSPENDED" state) the **Pause** option will be replaced with a **Resume** option. Click on this button to unpause/resume your demo. Doing so will override the runtime schedule that you set for your demo and will bring your instance back online. Note that Show will still pause/suspend your instance when it reaches the next suspend time as outlined in your runtime schedule.

Example: If your demo is set to run 09.00--18.00 for several days it will suspend at 18.00 each day. If you were to manually resume the stack in the evening on one of those days the demo will come back to a RUNNING state and will continue to run through until 18.00 the next day when Show will suspend again as per the schedule.

\$ Running Costs

A paused instance only incurs a minimal cost for the storage volume, saving 99% over a running instance in most cases!

i Instance Control Considerations

- If you need to access an instance outside of the scheduled operating hours, there are two options:
 1. Manually resume the instance - Pausing an instance within the scheduled operating hours will put it into a suspended state until the next scheduled start time. The opposite is the case as well: resuming/unpausing an instance outside of the operating hours will leave it online until the next scheduled stop time.
 2. Use Run Always (24/7) - If you need to have full control of the instance schedule, you can change to Run Always (24/7) to remove the schedule completely. You can set this either during the creation step or after the instance is online.
- A paused instance will not run any associated datagen, meaning when the instance comes back online, there is likely going to be gaps in the dashboards for the time it was suspended. While this will affect some demos and workshops, it will not affect those with static datasets, or those that run bulk backfills on startup.

Reboot Demo Instances

(Only available for Splunk Enterprise instances) Splunk Enterprise-based demo instances can be rebooted at any point from the moment you request them. This applies to both the provisioning process (i.e. if the stacks errors out or is stuck in STARTING for a long time) and also if the instance is already RUNNING but has become unresponsive.

To reboot a demo instance navigate to the demo's management page and click **Reboot**.

Transfer Demo Ownership

You can transfer the ownership of a demo or workshop instance to another user of Splunk Show. A transfer request is then sent to the requested new owner where they can accept or reject the transfer.

The dialog box titled "Transfer Ownership" has a close button (X) in the top right corner. It contains a text input field with the email address "jporter@splunk.com" and a green checkmark icon to its right. At the bottom, there are two buttons: "CANCEL" and "TRANSFER".

Enter the new user's email to transfer ownership

Add More Data Sources to Your Demo (Data Bundles)

Data bundles are datasets that you can add to your demo instance. Examples include:

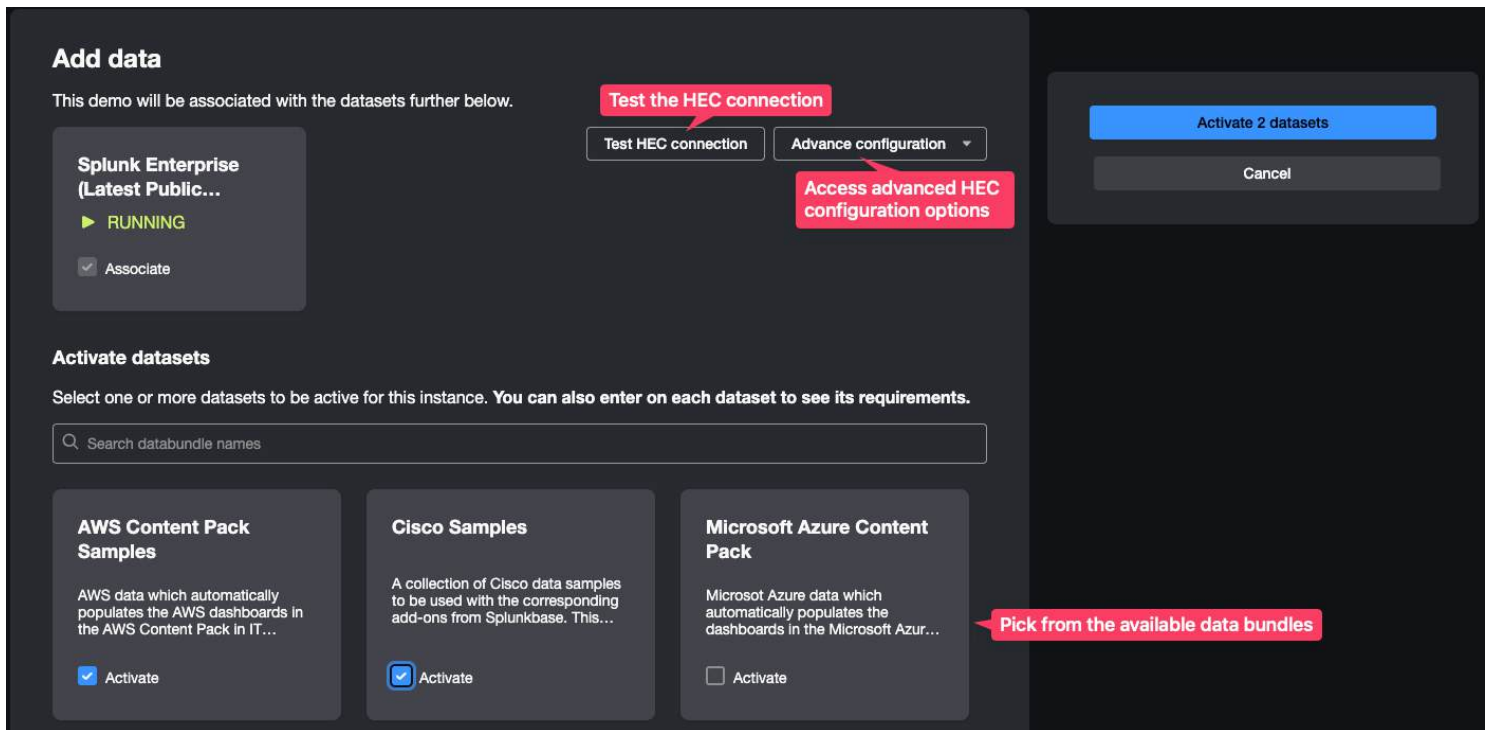

- AWS Content Pack
- Microsoft Azure Content Pack
- Palo Alto App Dashboard Samples
- Unix-Linux Infrastructure Overview for IT Essentials Work
- Windows Content Pack Dashboard Samples

Activate a Data Bundle

Once your HEC token is enabled, browse to the management page of your running demo (i.e. click on the running demo from the home page) and click **+ Add data bundles**. This will display the **Add data** page.

Add data bundle option greyed out?

Instances must be in a RUNNING state to access the + Add data bundles option. If your instance is still in provisioning or is currently rebooting then this option will be grayed out.

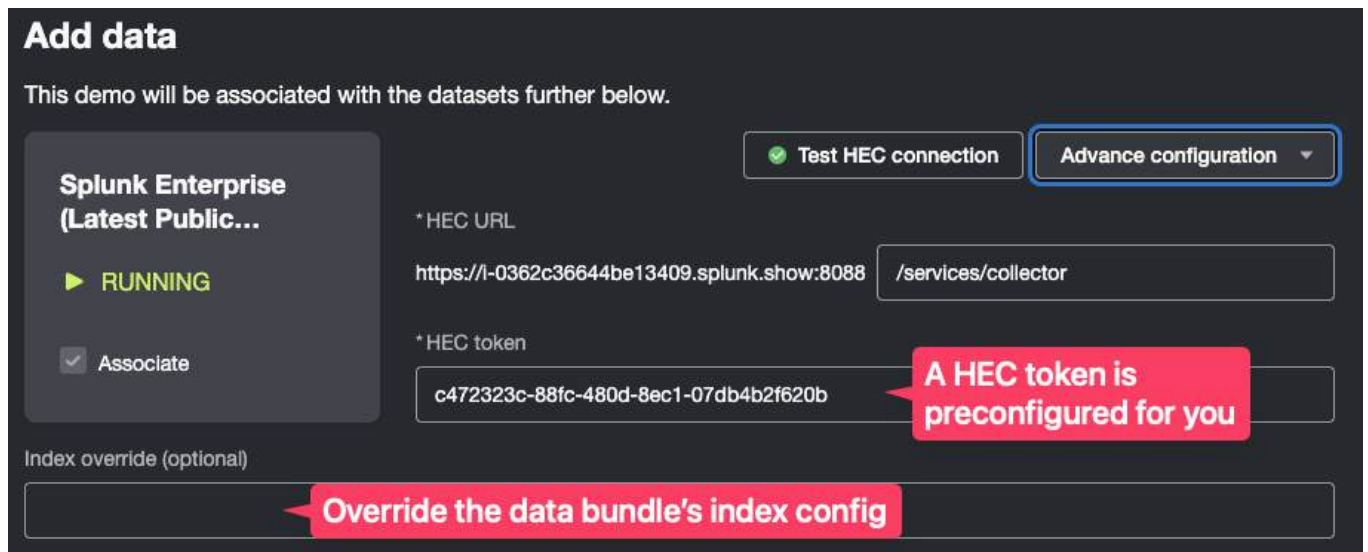

Example of adding data bundles to a RUNNING demo instance

- **Test HEC connection** - click this button to test the preconfigured HEC endpoint and token. A green tick will appear to indicate that HEC is configured and working.

- **Advance configuration** - click this button to view HEC information and customisation options.

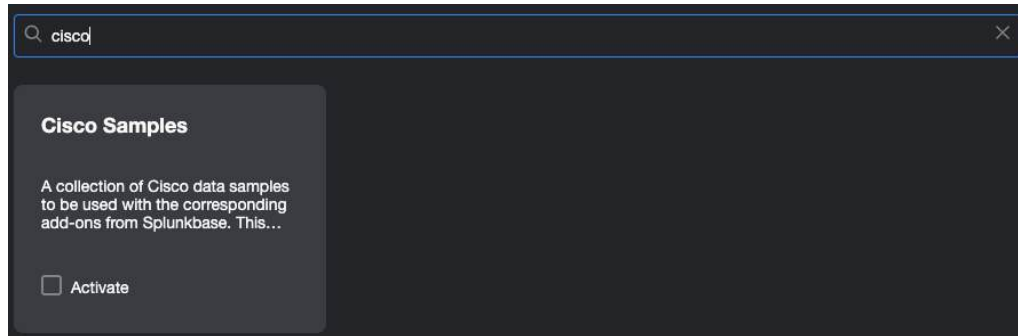

Viewing HEC advanced configuration options

- **HEC URL** - the HEC endpoint for the instance. You can optionally edit the endpoint URL if required, e.g. if you wish to send raw data to this endpoint.
- **HEC token** - the preconfigured HEC token for this instance. This can optionally be edited if you wish to use a different HEC token for this data bundle.

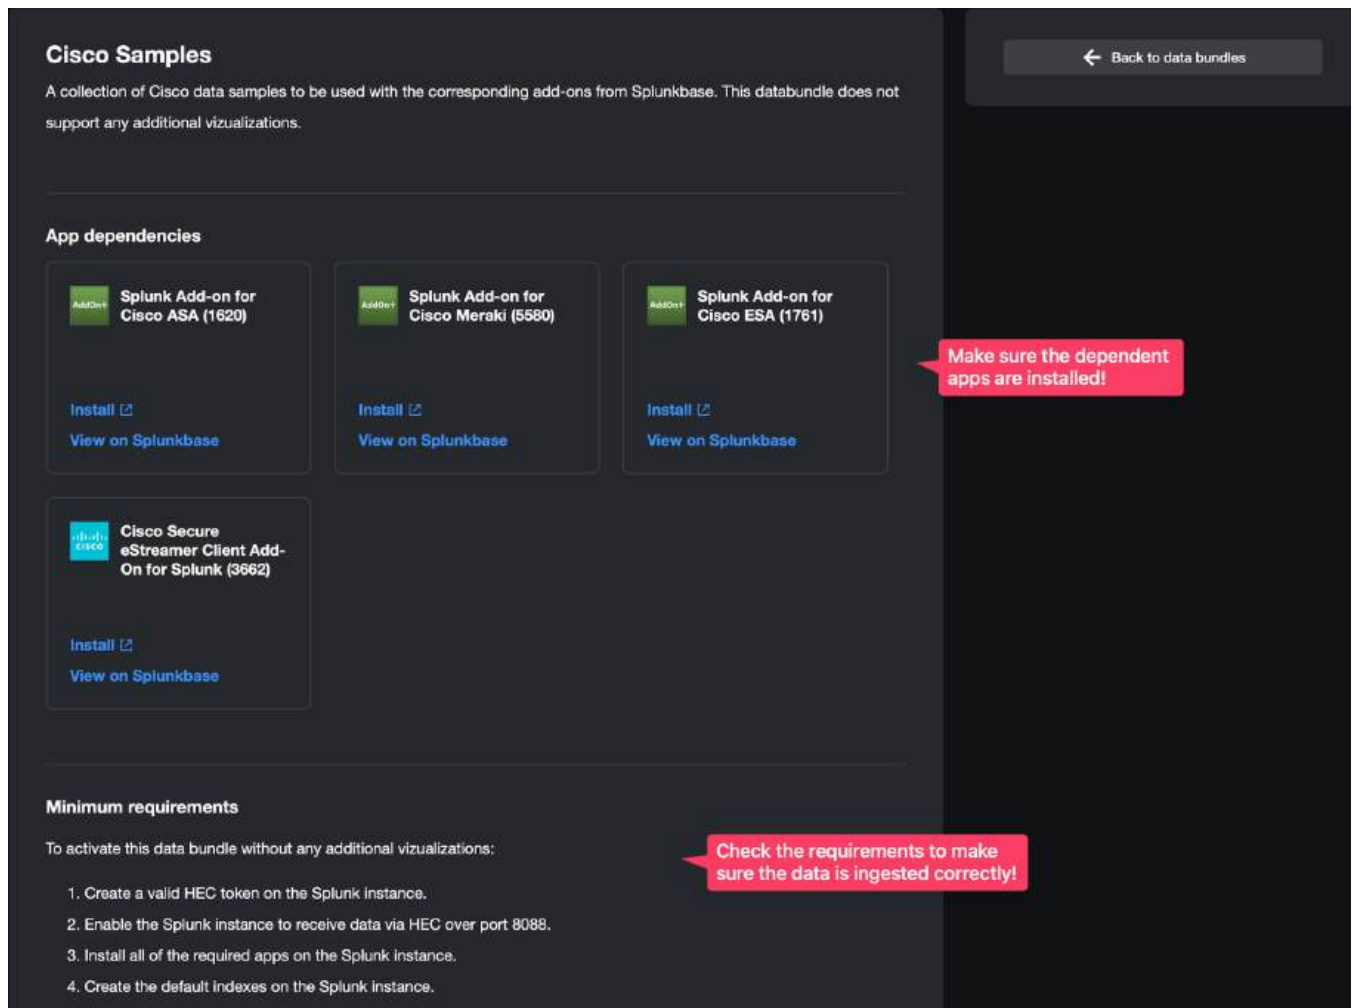

- **Index override (optional)** - if you wish to override the index that the data will be sent to enter the name of the index here. If this field is blank the data will be stored in the index(es) defined in the data bundle.
- **Activate datasets** - the available data bundles.

Type keywords into the search bar to search the available data bundles.

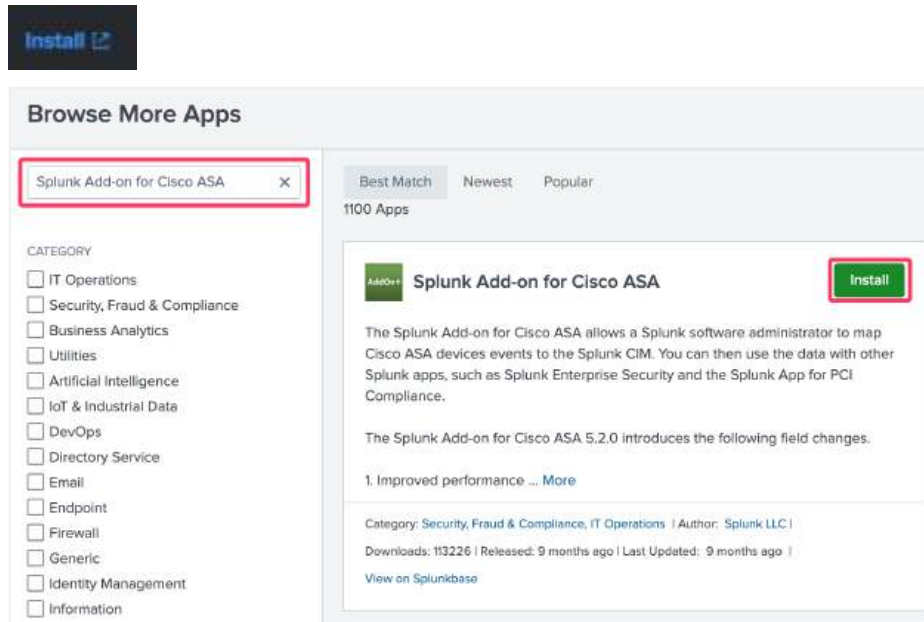

Type keywords to search the data bundles

Click on a data bundle tile to view detailed information about app dependencies and any additional setup required, such as any indexes you need to create. Be sure to follow these instructions to ensure that the data onboards correctly!

Example of a data bundle page showing app dependencies and setup information

App dependencies - click on **Install** to view the app within Splunk's native app installation view.

Clicking on 'Install' for an app dependency will take you to your Splunk instance and populate the app in the search box

Click on **View on Splunkbase** to navigate to the app's Splunkbase page where you can find more information about the app and also download it locally.

To activate a data bundle, toggle the '**Activate**' check box on the tile and click the **Activate x datasets** button in the top right to apply your changes.

Toggle 'Activate'

Activate the selected bundle(s)

i Activating and Deactivating Data Bundles

Due to the way data bundles work, when you activate or deactivate a data bundle your instance will temporarily display as **STARTING** in Show. Your instance should show as **RUNNING** after the changes have been made.

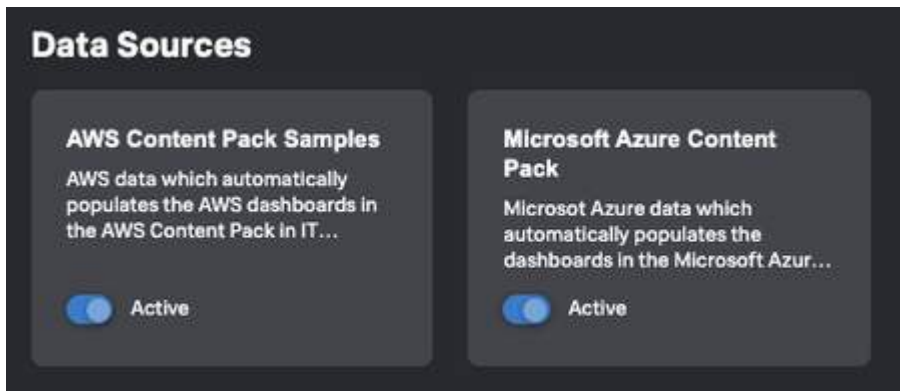

Data Bundle Setup

Please note that activating a data bundle in Show is just one step in the process - you will need to install the required apps/TAs and create indexes in order for the data to ingest correctly!

Check the details for each data bundle when activating it to make sure you have all the prerequisites complete!

Managing Active Data Bundles

When you add one or more data bundles to a demo you will see a **Data Sources** section on the management page for your demo.

A Data Sources section is added to your demo page when you add data bundles

Need to Edit a Data Bundle?

You cannot edit a data bundle once it is active.

If you need to edit a data bundle - such as to change the HEC token information - you need to deactivate the data bundle entirely and add a new one (see [Activate a Data Bundle](#).)

Accessing Demo Connection Information

Locate the requested demo you need to access on the home page under **My instances** and click on the demo. This will bring up the demo management page. Scroll down to the **Connection** or **Instances** section to view the connection URLs, usernames and passwords for your demo.

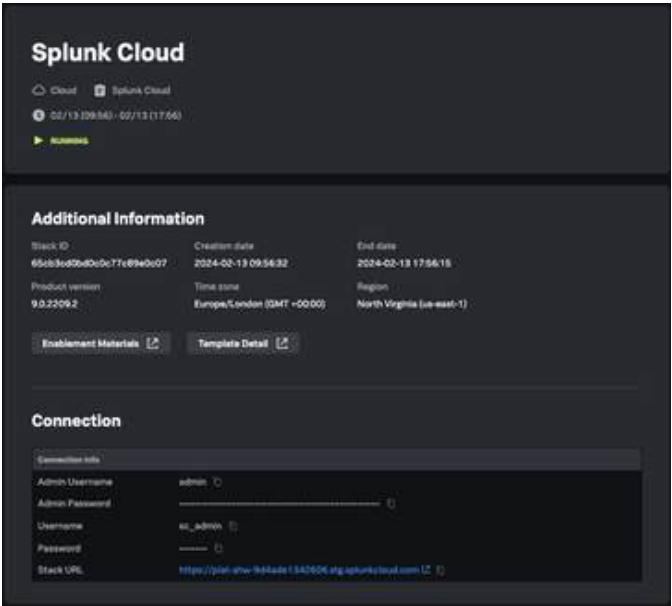

Example of connection information for a demo instance

For demos that feature multiple instances, this section will be called **Instances** and will display a tile for each instance. Clicking on the instance tile will present you with the full connection information for that instance.

Example of a demo with multiple instances

In a demo with multiple instances, click on the tile to view connection information for that instance

Always-on (Static) Demos

Always on (formerly “static”) demo instances are environments that are always running and can be accessed immediately. You can view the list of always on demos from the **Catalog** page by filtering for “Always On” demos.

Search content catalog

Use the Request filter to view only always on demos

⚠ User Permissions for Always On Demos

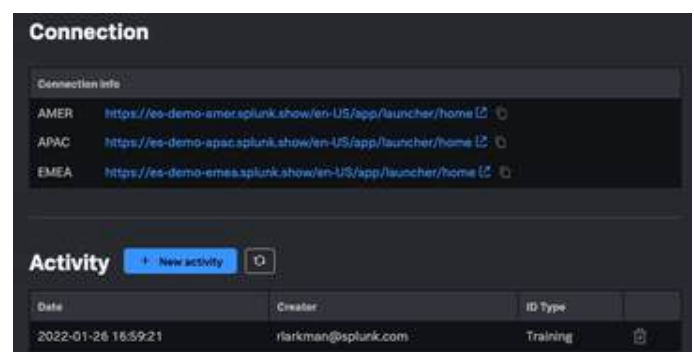

Since always on demos are shared environments, user permissions are typically restricted to prevent accidental changes that could impact other users.

If you need to make changes or customise a demo in any way you should leverage an on-demand demo (see [Create a Demo](#).)

To access an always on demo, click on the demo. You will need to add at least one activity before the connection details become available to you. Click on either **Add activity** or **+ New activity** at the bottom of the page to add an activity and reveal the connection information (see [Use Case](#) for information on the activity types.)

Example of blurred connection info on an always on demo

Connection information is revealed when you add an activity

Shared Demos

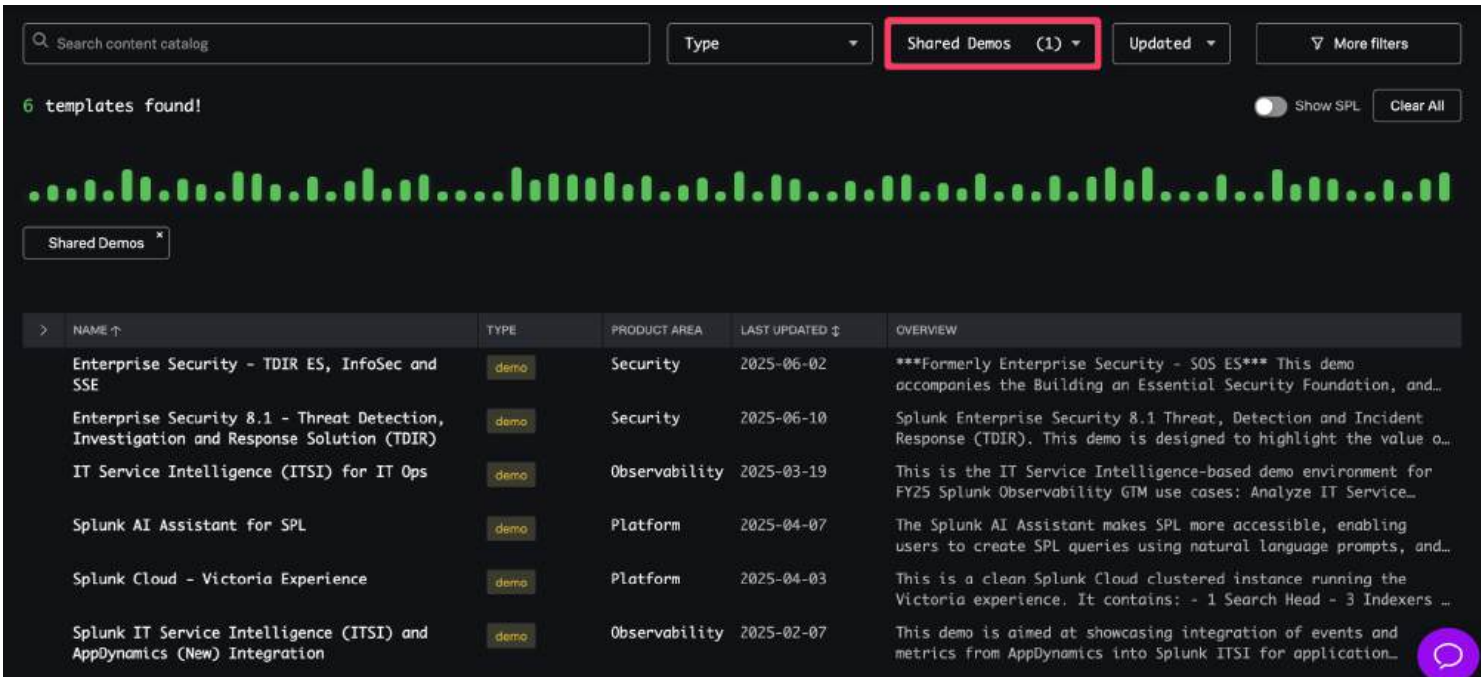

Shared demos are on-demand demo instances that requestors have marked as “shared” (see [Demo Details](#).) This option provides users with quick access to provisioned demos where you would otherwise have to wait for the instance to provision.

You can find shared demos on the **Catalog** page by filtering for ‘Shared Demo’.

👍 Shared Demo Best Practices

As a best practice, **do not modify the content of shared demos**. Since any number of users may be leveraging the demo at any given time, it is best to keep it as standard as possible.

If you need to customise the demo content for a customer, you should request a new instance (see [Create a Demo](#).)

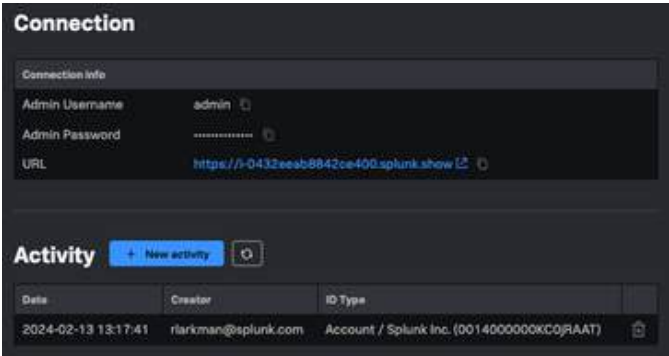

Example of shared demos displayed on the filtered Catalog page

To leverage a shared demo, click on the demo and add an activity to reveal the user credentials for the instance.

Example of blurred connection information on a shared demo

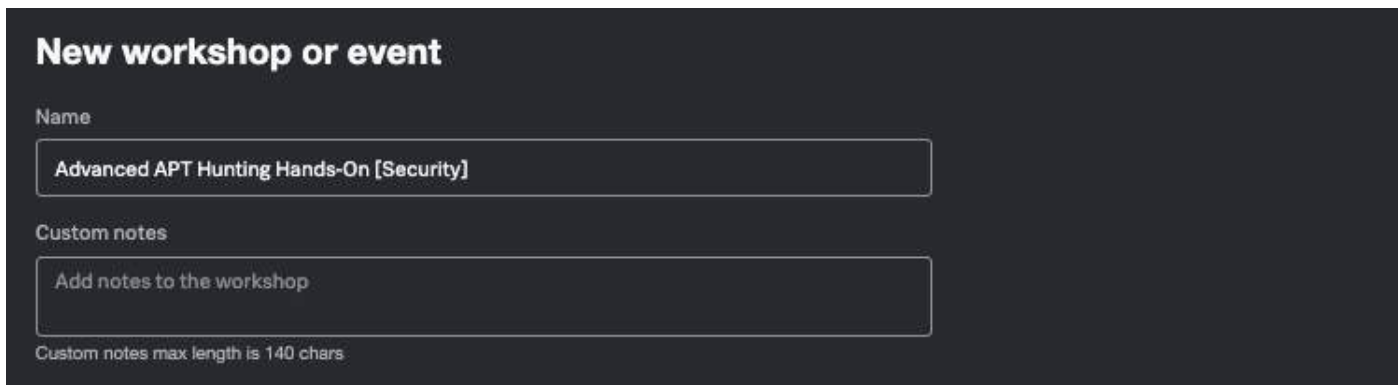

Connection information is revealed when you add an activity

Creating a Workshop/Event (Create Workshop Page)

Workshops are designed as hands-on environments for groups of participants, led by Splunkers and Technical Partners. An 'event' is a type of workshop in Splunk Show that requires users to enrol in the workshop using a splunk.com account and provides a self-service method for participants to access their workshop instance information.

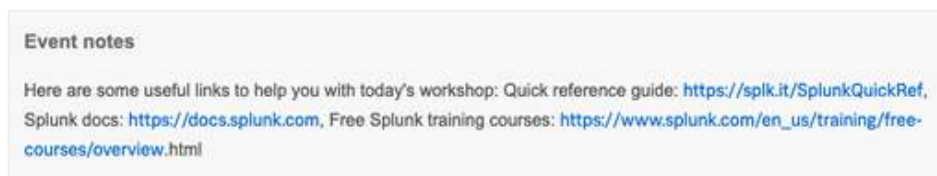

When you click on the **New workshop** button for a workshop template you are taken to the **Create workshop** page with the following options available to you:

New workshop or event

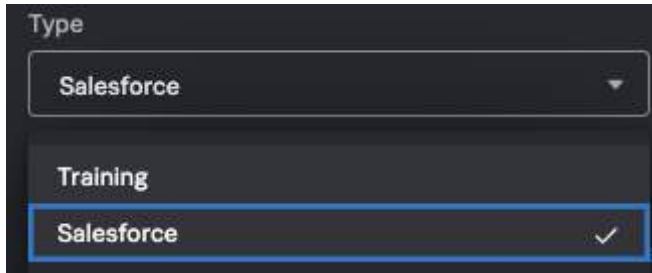

- **Name** - the customisable name of the demo instance
- **Custom notes** - a free text field for any notes related to this workshop (URLs will be detected and made clickable). If you're creating a workshop event then these notes will be visible to enrolled users on the events page.

i Custom Notes Tip: Enter useful workshop resource URLs to help your attendees!

Example of what workshop attendees will see when you
add a custom note to an event

Use Case

A screenshot of a 'Type' dropdown menu. The dropdown is open, showing three options: 'Salesforce', 'Training', and 'Salesforce'. The 'Salesforce' option at the bottom is highlighted with a blue border and a checkmark, indicating it is the selected option.

The reason for the demo instance, which has three options:

- **Training** - (not suitable for customer facing activities) the workshop is for enablement/learning purposes. When you select this option the following limits will apply:
 - You will be limited to only 1 instance per demo/workshop template in Show
 - You will be limited to a maximum runtime of 1 day
- **SFDC (Salesforce.com) activity** - the workshop is being spun up for a customer-facing activity related to one of the following Salesforce entities:

A screenshot of the 'Use Case' form. The form has a title 'Use Case' and a section 'SFDC activity' with a link '(use training activity)'. Below this, there are two fields: 'ID Type' with a dropdown menu showing 'Select a type', and 'ID Number' with a text input field labeled 'Enter an existing ID' and an information icon.

- **ID Type**
 - Account
 - Opportunity
- **ID Number** - Simply enter the name of the customer you are running the workshop for - no formal Salesforce ID is required.

Network

Network

DNS Prefix

https:// .i-123.splunk.show

Alphanumeric and hyphen characters only

SSH access ☐

- **DNS Prefix** - a customisable label that will be included in the DNS records and instance URLs for this workshop. This helps organize the instance URLs once provisioned. For example, entering `abc` as the prefix will result in instance URLs that looks like this:
`https://abc-i-08115630654cebf93.splunk.show`
- **SSH access** - (only available on some Some Enterprise based templates) this option allows you to enable SSH access to the instance. Once enabled, the SSH access information will be available under the instance details alongside your Splunk login credentials.

Runtime

Runtime

Schedule

Operating hours ⓘ

System default operating hours

Choose days

☐ Sun ☒ Mon ☒ Tue ☒ Wed ☒ Thu ☒ Fri ☐ Sat

Start time End time Time zone

08:00 18:00 Europe/London (GMT +00:00)

Provides options to customise the running schedule for your instance(s).

Options include:

- **Schedule** - select whether you want your workshop to be spun up immediately ("**Now**") or at a future date/time ("**Schedule**").

If you select Schedule you have the following additional options:

- **Schedule Start** - the date when your workshop instances will be spun up

- **Time** - the time (on the 'Schedule Start' date) when your workshop instances will be spun up
- **Time zone** - the time zone for the 'Time' value provided

Options available when scheduling an instance

- **Lifetime** - the Time-to-Live (TTL) for your workshop instances (minimum of 2 hours, maximum of 14 days.)

Note: If you select 'Training' for your use case you will be limited to a maximum lifetime of 1 day. If you need the workshop to run for longer, enter a Salesforce activity for the use case.

- **Operating hours** - (can only be changed on Splunk Enterprise based templates) this allows you to create a custom schedule for the instance, selecting the days and time window you would like to have the instance available. Once selected, Splunk Show will automatically pause/restart the instance at the scheduled time.

The available time window selections are:

- **System default operating hours** - this is the default choice, which will set a typical business hour schedule from 8:00AM-6:00PM localized for your timezone (as reported by the browser).
- **User default operating hours** - Within Account Settings > Preferences > Scheduled Instances, there is a place to set a user-defined schedule if you operate outside of typical business hours, or have use cases that require different time windows.
- **Custom operating hours** - this option is to set a schedule for that specific instance in cases where a one-off schedule is required.

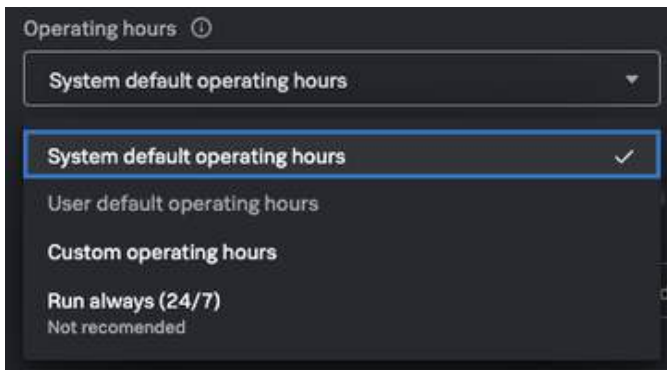

Example of using 'Custom operating hours'

If you select Custom operating hours you have the following additional options:

- **Choose days** - select the specific days of the week and hours of the day when you want your instance(s) to run. Please consider the cost implications of running instances for extended hours.
- **Run always (24/7)** - the instance will not follow a schedule and will remain online the entire specified time. Note that Splunk Cloud stacks can only run 24/7.

i Splunk Cloud based templates

Splunk Cloud instances must run 24/7 and their operating hours cannot be customized. This is noted within the Splunk Show UI.

Available options for instance 'Operating hours'

Example message where a template is Cloud based and the schedule cannot be customized

Template Fields

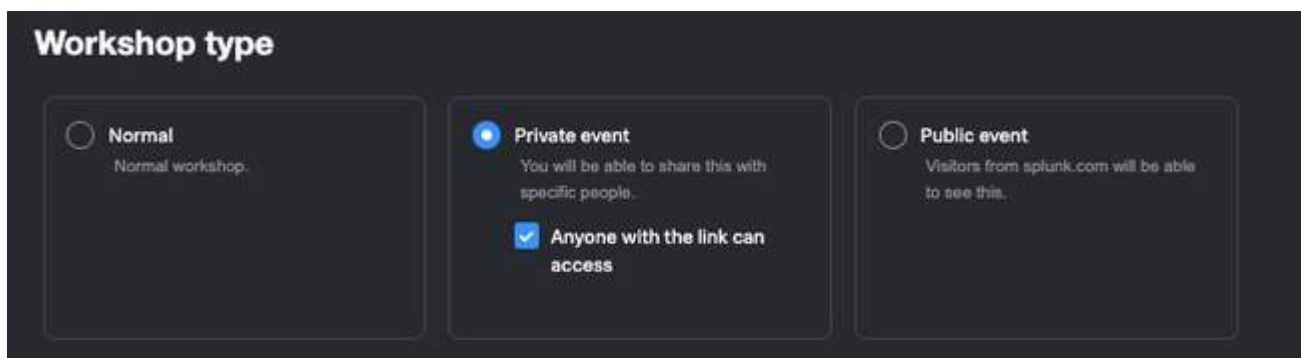

Some templates include the option for a 'Workshop Monitor' instance. If this option exists you will see a dropdown option where you can choose whether to include one.

Splunk Show Workshop monitor provides a quick view into your workshop instances and helps you to see how engaged attendees are in using the environment.

Using Workshop Monitor

For more information on this feature please see [Monitoring Workshop Instances](#).

Workshop type

There are three workshop types available in Show

- **Normal** - a "traditional" workshop where you request a specific number of workshop instances up front. **No Splunk.com account is required.** Once provisioned, instance details and access information can be downloaded into a csv file for distribution to participants of the workshop. No record of participants is kept by Show (as there is no enrolment) - it's all down to you!
Ideal for: "Old school" workshops where you're happy to manually manage instances and hand out credentials to

participants.

- **Private Event** - a workshop that allows you to invite participants to an 'event' within Splunk Show. This method requires attendees to have a splunk.com account. Invited participants can either use a direct link to access and enrol in the workshop event or you can invite them individually via their email address. When you use the email invite method invitees will receive an email to enrol in the event. You will also get a CSV list of enrolled users at the end of the workshop.
On the day of the event, instances will be spun up and participants can log in to Show (using their splunk.com account) to access their assigned instance information.

Ideal for: Workshops where you want to limit enrolments to only those who have the event link or who have been directly invited.

- **Public Event** - similar to private events but requires no invitation as anyone who logs in to Splunk Show (using a splunk.com account) can see and enrol in the workshop event. You will also get a CSV list of enrolled users at the end of the workshop.

Ideal for: Public workshops/events where you want to allow open enrolments.

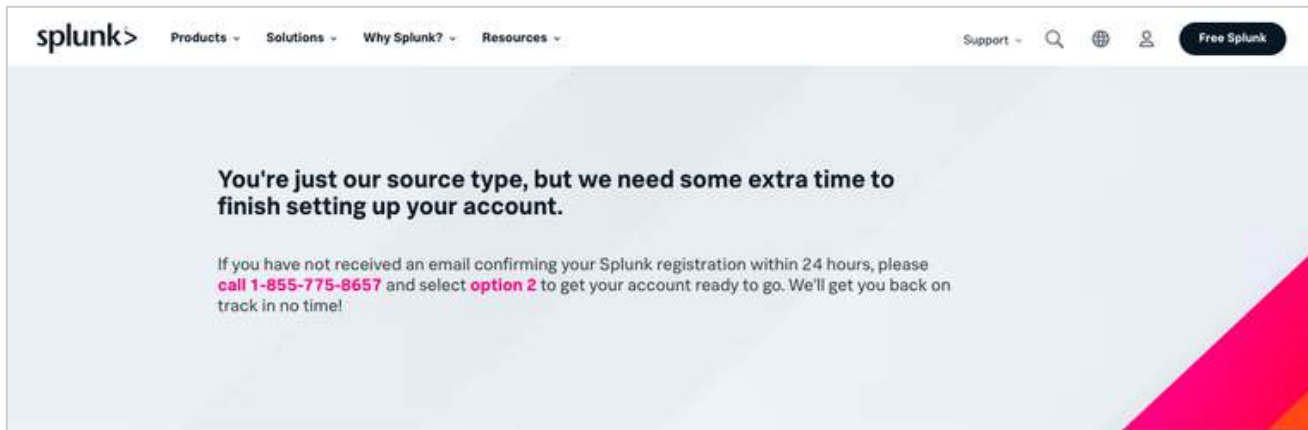

Public/Private Events

Event participants must use their splunk.com account when accessing Splunk Show. There is currently no ability to invite anonymous participants. For those use cases you should use the 'normal' workshop type.

Splunk.com Accounts

Please see [Splunk.com Registration Best Practices](#) for more information on making the Splunk.com registration process as smooth as possible.

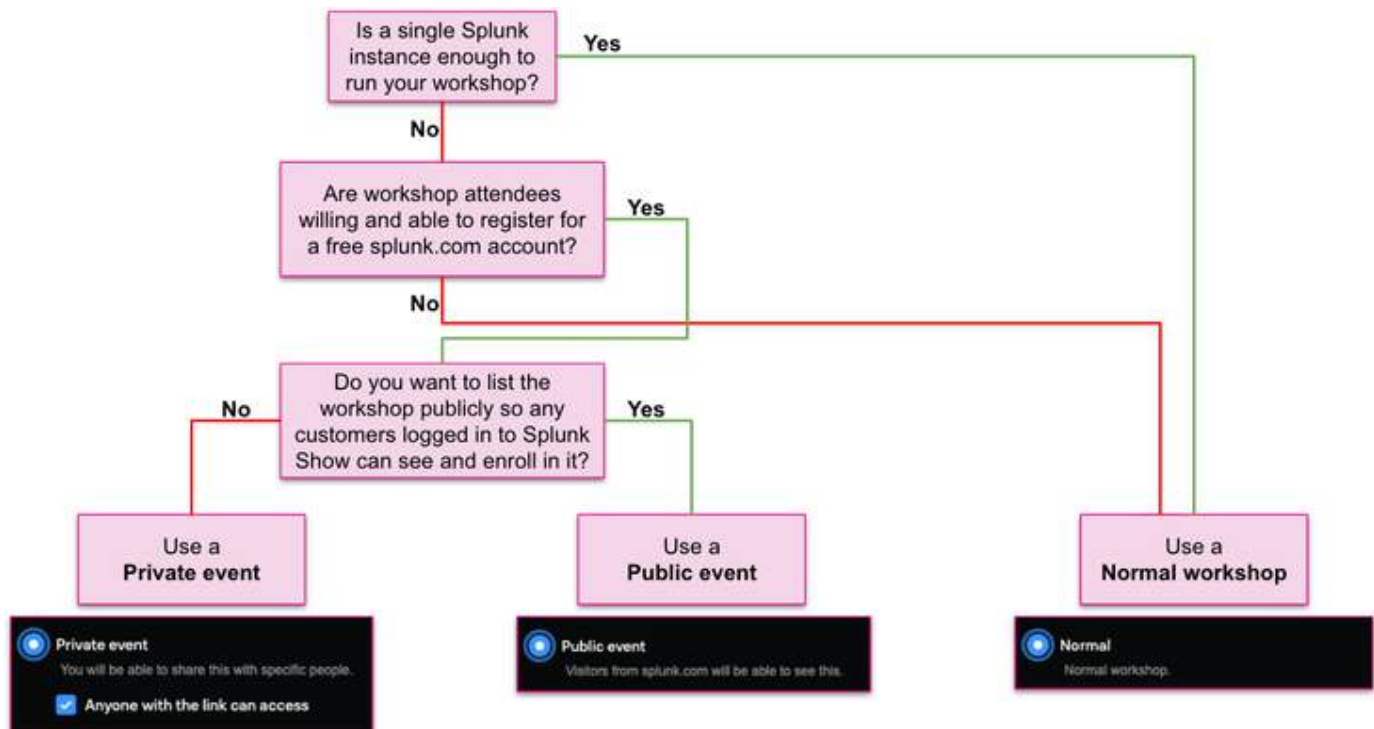

If customers have followed the registration best practices above and still experience registration messages such as the one in the screenshot below, these are most likely related to the US government mandated Denied Parties List (DPL) screening process. In these instances please reach out to the Splunk account team for support.

Example Denied Parties List (DPL) screening message during a splunk.com account registration

Choosing a Workshop Type

Follow this flow to decide on which workshop type is best for your activity:

Instances

Based on template capacity and estimated participants these are the required instances quantities.

☐ Set participants quantity manually (unused instances will be terminated 1 hour after the event start)

Estimated participants Region Apply to all ⓘ

1
North Virginia
☒

Maximum quantity 999

APT Hunting Quantity

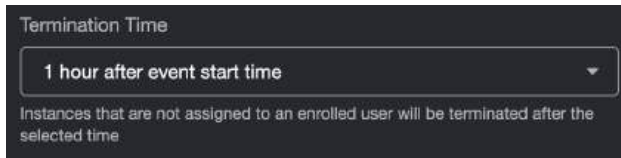

1

1000 is the maximum for opportunity use cases.

☒ Receive an email with the participants at the end of the event

- Provisioning Start** - the date/time when the instances should be provisioned by the system. Consider the number of instances and average provisioning time for the given template when selecting how far in advance you want the provisioning to start.
 - Now** - your instance(s) will be provisioned immediately
 - Future** - your instance(s) will be provisioned at the date and time specified.
- Event Start** - (applies to events only) the date/time when enrolled participants will be allowed to access the event. After the Event Start date/time, participants will be able to see the access details for their assigned workshop instance.
 - Instances**
 - Set participants quantity manually** - (available only for events) selecting this will allow you to manually set the *Estimated participants* and workshop instance values. Doing so allows you to specify how many instances you want Splunk Show to provision up front (at the *Provisioning Start* time). This allows you to have a set number of instances available to assign to users as they enroll in the event either right before or during the workshop. For large workshops (50+ participants) this option will likely reduce the waiting time for instance provisioning during the workshop itself.

- **Termination Time** - This option allows you to control how long unallocated instances will run for before Show automatically terminates them (if users enrol in the Show event they will be allocated an instance so this setting will only impact users who don't enrol.)

Termination Time

1 hour after event start time

Instances that are not assigned to an enrolled user will be terminated after the selected time

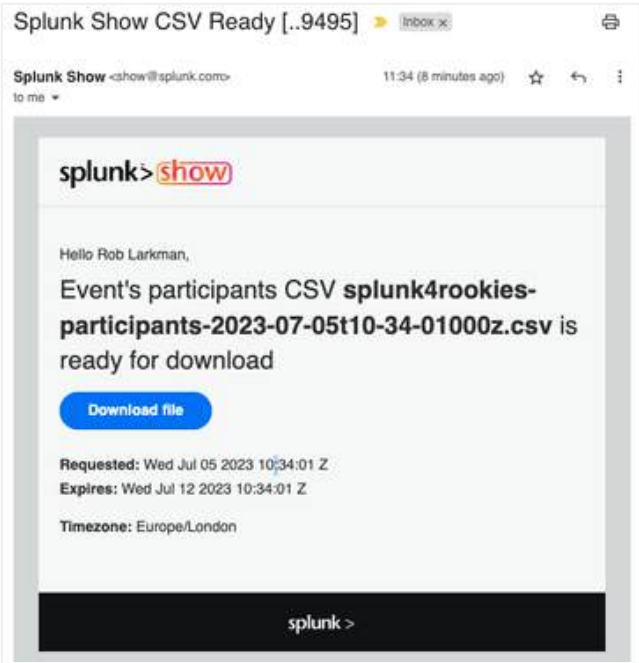

Set how long you want unallocated instances to run for before Show terminates them.

⚠ Important Notes About Using This Setting:

By default any unassigned instances that have not been allocated to a user during the enrolment process will be automatically terminated 1 hour after the *Event Start time* to save costs. To avoid this happening, you must get your attendees to enrol in the event or extend the time using the *Termination Time* dropdown.

If you intend on just sharing the instance details with your participants via a CSV list (i.e. not having them enrol in an event via Splunk Show) then you should run your workshop as a 'Normal workshop' and not an event.

- **Estimated Participants** - (available only when 'Set participants quantity manually' is checked) the number of estimated participants for this workshop. Once entered, Splunk Show will calculate the required number of each instance, which can be increased or decreased manually. For workshop events, instance requests are determined by the number of enrolled users, not a pre-set count. If you enabled the *Set participants quantity manually* option, Splunk Show will automatically provision a number of workshop instances based on the value selected here.
- **Region** - the AWS region where the instances will be spun up and hosted. Currently, all instances for a workshop must be located in the same region.
- **Splunk Enterprise Quantity** (the exact name will vary depending on the template) - the number of instances required for this workshop. This number is dynamically calculated by Splunk Show based on the *Estimated participants* value (e.g. some workshops leverage shared instances, others use a 1:1 mapping between attendees and instances.) If you enabled the *Set participants quantity manually* option Splunk Show will automatically provision a number of workshop instances based on the value selected here.
- **Receive an email with the participants at the end of the event** - this option is enabled by default - with this option selected you will automatically receive an email when the event has ended, containing a CSV list of your event participants.

Example of participants list email

Managing a Workshop

Managing a 'Normal Workshop'

To manage a 'Normal workshop' (i.e. not an event), locate the workshop on the home page under **My instances** and click on the workshop.

A workshop listed on the home page under 'My instances'

When managing a workshop the same base options apply as when managing demo instances (see [Managing a Demo](#).)

i Obtain a List of Instances for a Normal Workshop

Since a workshop typically consists of multiple Splunk instances, you will need to access and distribute the connection details to workshop attendees. Download the list of instances by browsing to your workshop's management page and clicking on the **CSV** button under the **Resources** section.

Note: The workshop instances must be running for the CSV export option to be available. This is due to the backend IP addresses changing when instances are paused and resumed. User credentials and URLs remain unchanged. If your workshop features SSH for any of the exercises then the SSH details will change after you resume a workshop (as they use the IP address to connect). In this scenario you will need to reissue the attendees' SSH details after resuming your workshop.

Example of downloading a CSV list of instance for a Normal workshop

adminUsername	adminPassword	url
admin	changeme	https://i-049bf1a09b730a631.splunk.show

Example of monitoring instance credentials

Using Splunk Show Workshop Monitor

All attendee instances will automatically forward their internal logs to the monitoring instance, allowing you to view insights around the engagement of workshop attendees from a single dashboard.

Login to the Splunk Show Workshop Monitor using the credentials provided and you will see the analytics dashboard.

Workshop insights are provided via the Splunk Show Workshop Monitor instance

Managing an Event

To manage a workshop event, locate the event on the home page under **My instances** and click on the event.

An event listed on the home page under 'My instances'

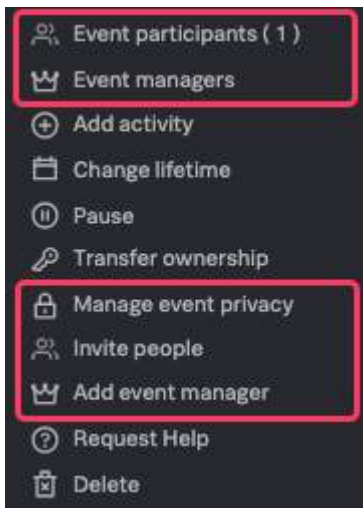

In addition to the options available for a 'Normal workshop', events have the following additional options:

- **Event Link** - this is the shareable link to your workshop event. Click this link to visit the event page. Alternatively, click on the copy icon to the right to copy the URL to your clipboard, ready to share with invitees. You can also edit this link via the **Invite people** popup window.

- **Customise the Event Thumbnail** - click on the upload button to customise the event thumbnail

- **Event participants** - allows you to manage the participants for your event, including viewing a list of attendees who are either enrolled or invited, inviting additional participants, exporting a CSV list of all participants and accessing participants' instance details.

Example of an event participant with a link to their instance

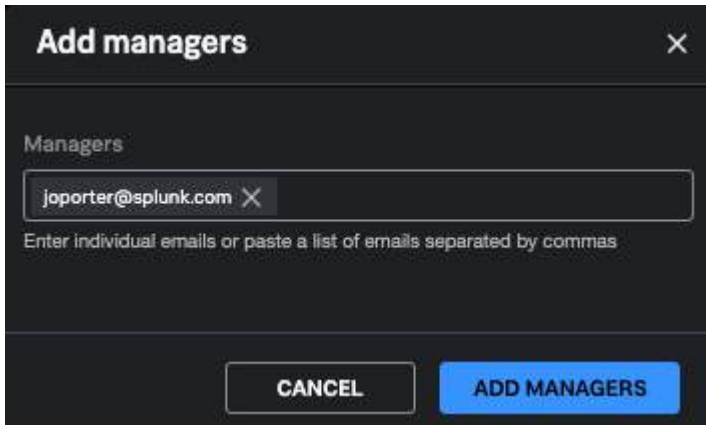

i Participants List

You should also automatically receive a list of event participants by leaving 'Receive an email with the participants at the end of the event' enabled when creating your event.

- **Event Managers** - allows you to add additional Show users as an event manager. Any users who are added as an event manager will see the event listed under **My instances** on their homepage and will have full access to manage users and workshop instances.

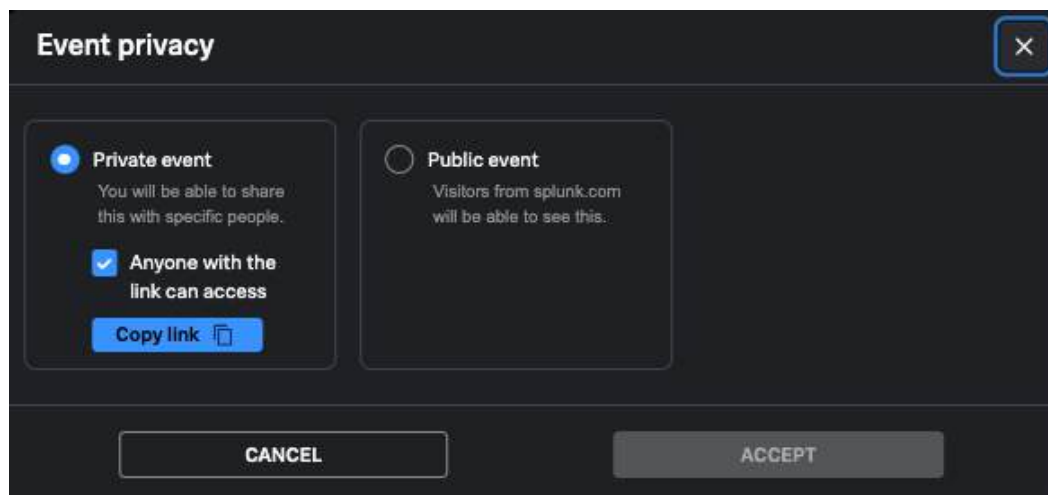

Click 'Add managers' to add a colleague to help manage your workshop

Add other Show users as workshop managers

- **Manage event privacy** - allows you to switch between making the event a **Public event** or a **Private event** (see [Workshop type](#) for more info!) You can also copy the direct link to the event (useful for sharing in a calendar invite) to your clipboard and enable/disable the option to allow anyone with the event link to access and enrol in the event.

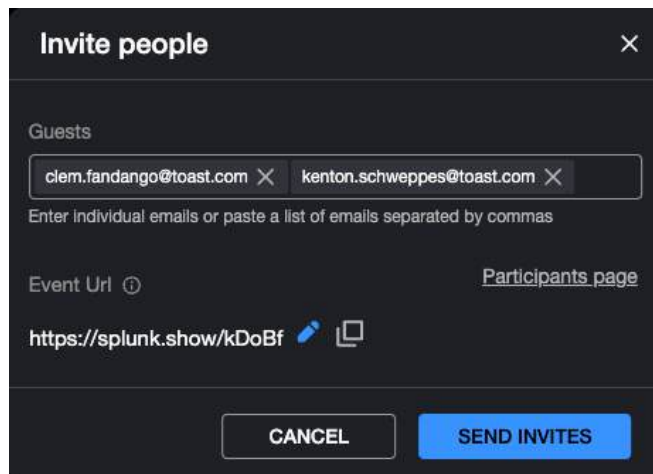

Switch between a public or private event at any time!

- **Invite people** - launches a popup where you can manage the following aspects of your event:
 - **Guests** - enter or paste in a comma-separated list of email addresses (invitees will receive an email from show@splunk.com with a direct link to the event)

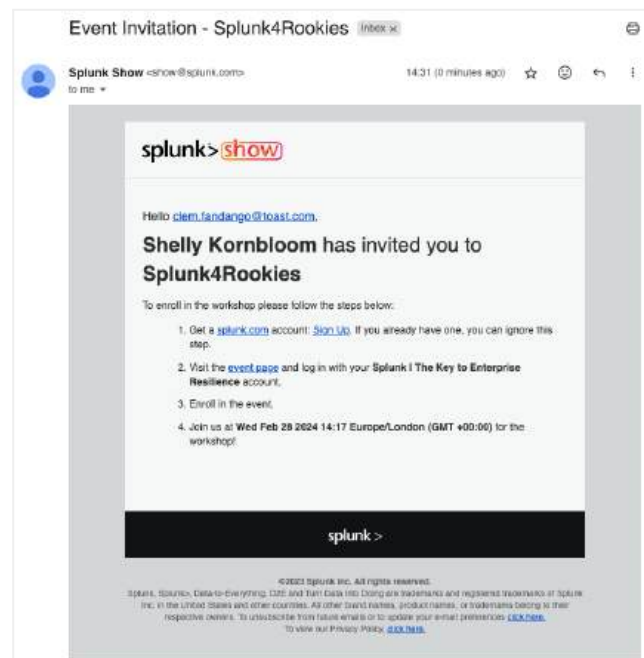

- **Event Url** - the unique link for your event. Either copy the event link to your clipboard by clicking the copy button or edit the URL by clicking on the on edit button. You can then customize the last part of the URL.
 - **Discard Old Links** - when this option is enabled, Splunk Show will automatically purge/delete the previous custom URL you used. If you disable this option, any custom URLs you have used for this stack will be retained (and will continue to work) until the stack is terminated, at which time the custom URL(s) will be deleted and can be used again by you or someone else.

You can customize the event URL

Example of inviting two people using their email addresses

Example invite email from Splunk Show

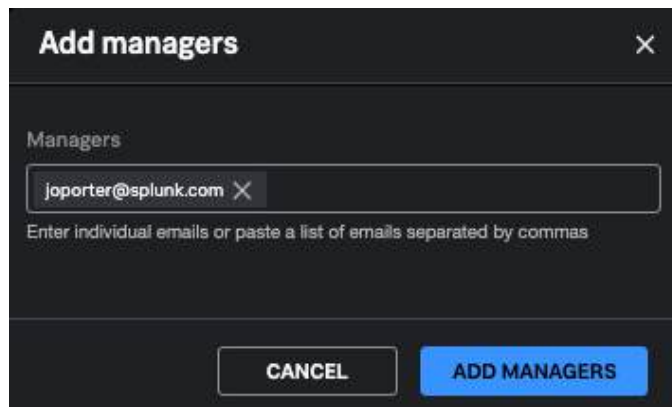

i Want to know when someone has enrolled in your event?

You can optionally enable the 'ON USER ENROLLMENT TO EVENT' Slack or Email notification(s) under your Show user settings.

Please see [Notifications](#) for instructions on how to manage notifications.

- **Add event manager** - launches the 'Add managers' popup where you can add the email address of another Show user. They will receive an email invitation - as well as a notification within Show - to join your workshop event as an additional manager. If they accept the invite they will have full access to the event management page as if they had spun up the event themselves.

All managers have full access to manage all aspects of a workshop

Customise the Event Thumbnail Image

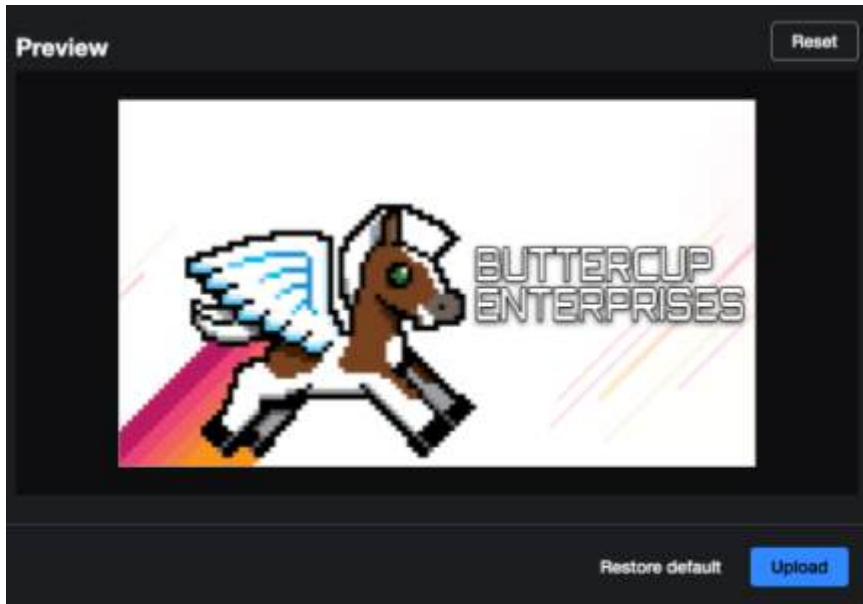

You can customise your event thumbnail image by clicking on the upload button in the corner of the image.

Click on 'upload file...' and browse to the image you want to upload.

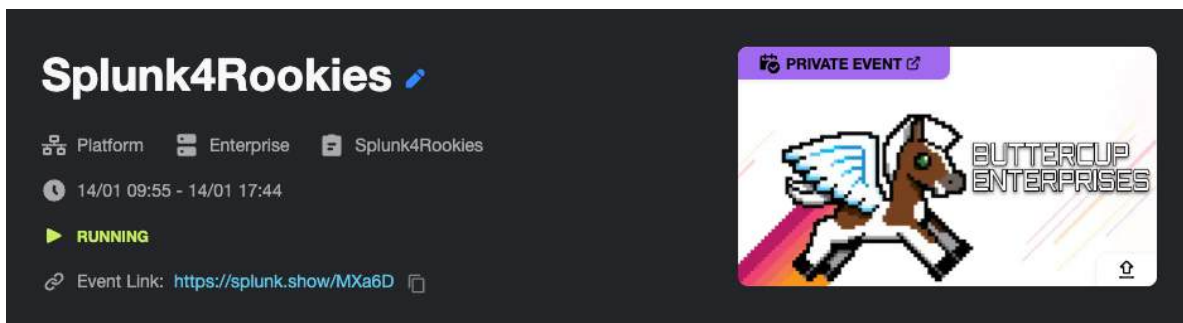

Move the image to fit within the available area and click on **Upload** to add your image. If you need to reset the image back to the default, click on **Reset**.

Click and drag to move your image. Scroll to zoom in and out.

The workshop event will now use your custom image!

Editing the Schedule of an Event

If your event is still **SCHEDULED** you can edit the provisioning time (the time when the instances will be spun up) and the Event Start time (the time when attendees will be able to access their instance information from the event page.)

Edit the schedule by scrolling to the **Provisioning Time** section and clicking on the edit button. Click on **Submit** to save your changes.

--:-- ⌚ --:-- ⌚ Europe/London (GMT +00:00) ▼

Preferences

- **UI theme** - switch between Auto, Dark or Light UI themes

- **Preferred Region** - set the default AWS region that Show will use when you create new demos and workshops. This will only change the default region that is selected - you will still be able to override this when requesting an instance (see [Demo Details](#)).
- **Timezone** - set the default timezone that Show will use when you create new demos and workshops. This will only change the default timezone that is selected - you will still be able to override this when requesting an instance (see [Runtime](#)).
- **Scheduled Instances** - set the default running schedule that Show will use when you create new demos and workshops. This will only change the default running schedule that is selected - you will still be able to override this when requesting an instance (see [Runtime](#)).

Notifications

To enable Slack and Email notifications, you will need to opt-in within the Splunk Show interface. In the upper-right corner, hover over the down arrow and click on **Account Settings**.

Enable Slack Notifications

Under **Slack Notifications** click **Add to Slack**. You will be taken to a Slack web page asking permission to connect Splunk Show to your Slack account/workspace. Click **Allow** and you will be redirected back to Splunk Show.

Enable Email Notifications

Under **Email Notifications** click **Enable Email Notifications**.

By default all notifications are off, but you can opt-in to all of them, or just select the ones you find most relevant.

As an example, to be notified a specific amount of time before an instance is stopped, you can click **+ Add Notification** and set the desired amount of time.

Disable Notifications

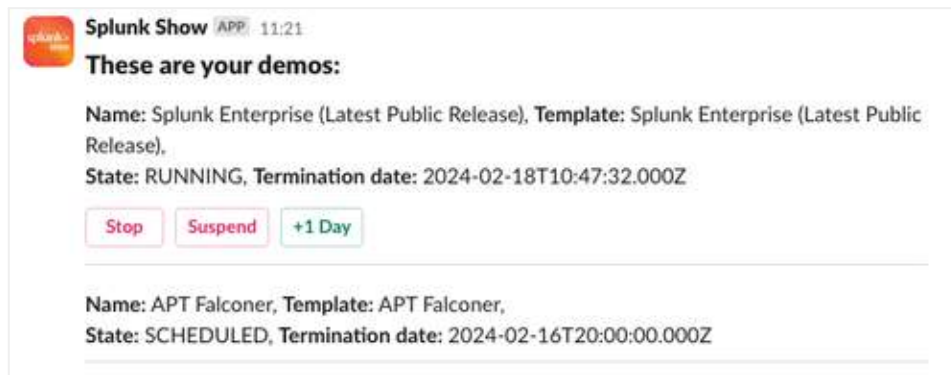

Disable Slack or email notifications at any time by clicking the **Unlink Slack** or **Disable Email Notifications** buttons respectively.

Splunk Show Slackbot

- Slack notifications will be sent by the Splunk Show app.
- Two new slash (/) commands are now supported in Slack:
 - `/list-demos` - lists the demos you currently have running or scheduled, allowing you to stop, suspend or extend (1 day at a time) running demos directly from Slack!
 - `/list-workshops` - provides the same functionality as above, but for workshops.

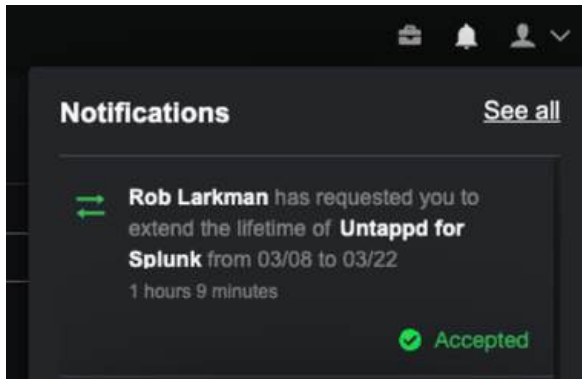

Example of using the `/list-demos` command in the Splunk Show Slackbot

- For more advanced instance management or access details, you will still need to use the Splunk Show UI.

In-app Notifications

A notifications icon is now part of the navigation bar and will list interactions with specific features within Splunk Show.

Currently this is limited to ownership transfers and stack extension requests, but watch out for further notification types in future!

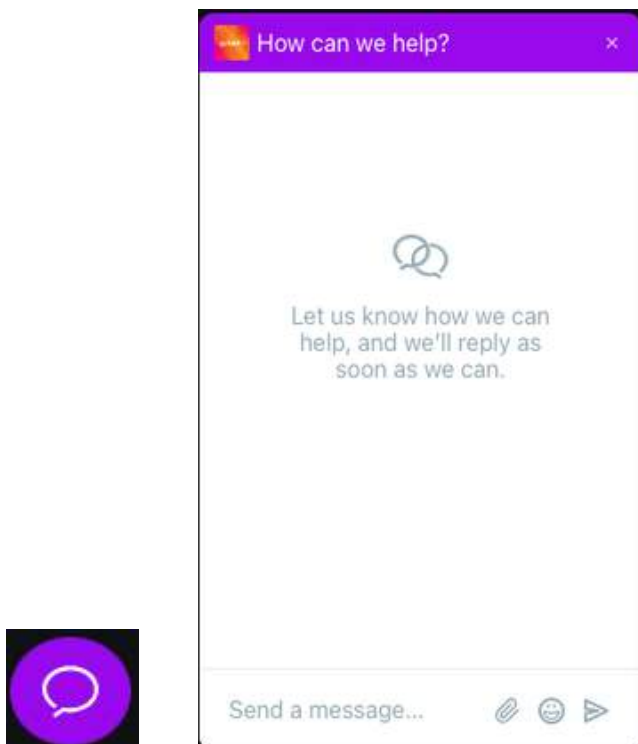

Support Requests

Infrastructure Issues

For issues, questions or concerns around using the Splunk Show platform, please email splunk-show@cisco.com or use the web chat feature in the bottom right corner of Splunk Show (currently resourced during US office hours).

Got an Issue with Demo/Workshop Content?

If you have a question or issue with demo/workshop content (e.g. “the demo script has incorrect screenshots” or “the slide deck has a mistake on it”, etc.) please see [Content Issues \(Submit Content Feedback\)](#).

Splunk Show team!

Content Issues (Submit Content Feedback)

If you have a question or issue with demo/workshop content - e.g. “the demo script has incorrect screenshots” or “the slide deck has a mistake on it”, etc. - you can submit content feedback directly to the content owner by clicking into any demo or workshop template and clicking on the **Submit Content Feedback** button.

On the popup **Send Feedback** window, enter your content feedback and click on **Send** to submit it to the content owner.

A screenshot of a 'Send Feedback' popup window. The title bar says 'Send Feedback' with a close 'X' button. The main text reads: 'Feedback is sent to the content owner(s) and the Show team via email. You will be cc'd on the message for further discussion. You are submitting feedback for Splunk4Rookies.' Below this is a large text input field with a cursor. At the bottom, there is a note: 'For issues with the availability or performance of a specific instance, please reach out to the Show team directly via the chat icon in the bottom-right corner.' At the very bottom are two buttons: 'CANCEL' and 'SEND'.

i Got a Technical Issue with a Running Instance?

Technical issues related to the running of your demo/workshop - such as instances not spinning up or data not appearing in a specific instance - should be raised as a support request (see [Infrastructure Issues](#).)
